1. About this Guide

This quick start guide provides enough information to deploy the appliance, configure a simple load balanced test environment and test and verify its functionality.

Note:
Please also refer to the Administration Manual for much more detailed information on setting up the appliance and configuring a load balanced solution. For information on configuring the appliance for specific applications, please refer to our extensive library of Deployment Guides.

2. Appliance Configuration Overview

Initial network configuration is carried out at the console using the Network Setup Wizard as explained on page 8.

Once an IP address has been allocated, load balanced services can be configured using the WebUI, either using the Setup Wizard (for Layer 7 services) or by manually defining the Virtual Services (VIPs) and associated Real Servers (RIPs).

By default, the WebUI is accessible on HTTPS port 9443. HTTP access on port 9080 can also be enabled if required as explained in the section “Appliance Security” below.

We always recommend that where possible two appliances are deployed as a clustered pair for high availability and resilience, this avoids introducing a single point of failure to your network.

We recommend that the master is fully configured first, then the slave should be added. Once a pair is configured, load balanced services must be configured & modified on the master appliance. The slave appliance will then be kept in sync automatically. For more information on configuring an HA pair please refer to page 19.

3. Appliance Security

SECURITY MODE
To control how the appliance is accessed and which features are enabled, 3 security modes are provided:

- **Secure** – this is the default mode. In this mode:
  - the WebUI is accessible on HTTPS port 9443. If you attempt to access the WebUI on HTTP port 9080 you will be redirected to HTTPS port 9443
  - access to the “Execute Shell Command” menu option is disabled
  - the ability to edit the firewall script & the lockdown wizard is disabled
  - ’root’ user console & SSH password access are disabled
- **Custom** – In this mode, the security options can be configured to suit your requirements
- **Secure – Permanent** – this mode is the same as Secure, but the change is irreversible

**IMPORTANT:**
Only set the security mode to Secure – Permanent if you are 100% sure this is what you want!

*To configure the Security Mode:*
1. Using the WebUI, navigate to: Local Configuration > Security
2. Select the required Appliance Security Mode
3. If Custom is selected, configure the other options to suit your requirements
4. Click Update

Note:
For full details of all options, please refer to the Administration Manual (page 81)

PASSWORDS
The password for the 'loadbalancer' WebUI user account and the 'root' Linux user account are set during the Network Setup Wizard. These can also be changed at any time as explained below:

1 – the 'root' Linux account:
As explained on page 3, 'root' user console & SSH password access are disabled by default. If enabled, the 'root' password should be changed at the console, or via an SSH session using the following command:

```
passwd
```  

2 – the 'loadbalancer' WebUI account:
This can be changed using the WebUI menu option: Maintenance > Passwords

SECURITY LOCKDOWN SCRIPT
The appliance also includes a security lockdown command (lbsecure) that enables passwords to be set, network access to be locked down and SSH key regeneration in one simple step. This command can be run on a single appliance or an HA pair. For more details please refer to the Administration Manual (page 79).

4. Deployment Concept
Once deployed, clients connect to the Virtual Service(s) (VIPs) on the load balancer rather than connecting directly to one of the load balanced servers. These connections are then distributed between the load balanced servers according to the load balancing algorithm selected.
Note:
We always recommend that 2 appliances are deployed as an active/passive HA pair. The slave appliance automatically takes over if the master unit fails. Please refer to page 19 for more information on configuring HA using 2 appliances.

5. One-Arm and Two-Arm Topologies

The number of ‘arms’ is a descriptive term for how many interfaces are used to connect a device to a network. It’s common for a load balancer that uses a routing method (NAT) to have a two-arm configuration. Proxy based load balancers (SNAT) commonly use a one-arm configuration.

One Arm
In this mode, the VIP and the load balanced servers are located in a single subnet. The load balancer requires a single network interface adapter – eth0 in the diagram below.

Two Arm
In this mode, 2 subnets are used. The VIP is located in one subnet and the load balanced servers are located in the other subnet. The load balancer requires 2 interfaces – eth0 and eth1 in the diagram below. Note that this can be achieved by using two network adapters, or by creating VLANs on a single adapter. It’s also possible to add a secondary IP address / subnet to a single network adapter.
6. Load Balancing Methods

The Loadbalancer.org appliance is one of the most flexible load balancers on the market. The design allows different load balancing modules to utilize the core high availability framework of the appliance. Multiple load balancing methods can be used at the same time or in combination with each other.

<table>
<thead>
<tr>
<th>Layer 4</th>
<th>DR (Direct Routing)</th>
<th>Ultra-fast local server based load balancing</th>
<th>One-Arm (*)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>- Requires solving the 'ARP problem' on the Real Servers – please refer to the Administration Manual (page 90) for more details</td>
<td></td>
</tr>
<tr>
<td>Layer 4</td>
<td>NAT (Network Address Translation)</td>
<td>Fast Layer 4 load balancing</td>
<td>One or Two-Arm</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- The appliance must be the default gateway for the Real Servers</td>
<td></td>
</tr>
<tr>
<td>Layer 4</td>
<td>TUN</td>
<td>Similar to DR but works across IP encapsulated tunnels</td>
<td>One-Arm</td>
</tr>
<tr>
<td>Layer 4</td>
<td>SNAT (Source Network Address Translation)</td>
<td>Fast layer 4 SNAT supporting both TCP &amp; UDP</td>
<td>One or Two-Arm</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Requires no Real Server changes</td>
<td></td>
</tr>
<tr>
<td>Layer 7</td>
<td>SSL Termination (Pound &amp; STunnel)</td>
<td>Usually required in order to process cookie persistence in HTTPS streams on the load balancer</td>
<td>One or Two-Arm</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- SSL Termination is processor intensive</td>
<td></td>
</tr>
<tr>
<td>Layer 7</td>
<td>SNAT (Source Network Address Translation using HAProxy)</td>
<td>Layer 7 allows greater flexibility including full SNAT and remote server load balancing, cookie insertion and URL switching</td>
<td>One or Two-Arm</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Very simple to implement</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Requires no Real Server changes</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Not as fast as Layer 4 methods</td>
<td></td>
</tr>
</tbody>
</table>

(*) DR mode can also be used in a multi-homed configuration where real servers are located in different subnets. In this case, the load balancer must have an interface in the same subnet to enable layer 2 connectivity which is required for DR mode to operate.

**Key**

- **Recommended for high performance fully transparent and scalable solutions**
- **Recommended if HTTP cookie persistence is required, also used for several Microsoft applications such as Exchange, Sharepoint & Remote Desktop Services and for overall deployment simplicity since real servers can be on any accessible subnet and no Real-Server changes are required**
- **Only required for Direct Routing implementation across routed networks (rarely used)**
- **Recommended when you want to load balance both TCP and UDP but you're unable to use DR mode or NAT mode due to network topology or Real Server related reasons**
Load Balancing Methods

Note:
Layer 7 SNAT mode is generally the simplest most flexible method to use. As mentioned above, it's not the fastest method but enables a robust load balancing solution to be rapidly deployed. This is illustrated by the simple example on page 15 of this guide.

Note:
Please refer to the Administration Manual (pages 26-32) for more detailed information on each load balancing method.

7. Appliance Deployment

VIRTUAL APPLIANCE
The VA is currently available for VMware, Virtual Box, Hyper-V, KVM, Nutanix and XEN and has been optimized for each Hypervisor. By default, the VA is allocated 1 CPU, 2GB of RAM and has an 8GB virtual disk.

Note:
The Virtual Appliance can be downloaded [here](#).

Note:
Please refer to the Administration Manual (page 35) and the ReadMe.txt text file included in each VA download for more detailed information on deploying the VA using various Hypervisors.

Note:
For the VA, 4 NICs are included but only eth0 is connected by default at power up. If the other NICs are required, these should be connected using the network configuration screen within the Hypervisor.

HARDWARE APPLIANCE
For details of all hardware models and information on installing and connecting the appliance, please refer to the Hardware Installation Guide.

CLOUD APPLIANCE

AWS
For details of deploying and configuring the Amazon Web Services (AWS) appliance please refer to the AWS Quick Start Guide.

AZURE
For details of deploying and configuring the Microsoft Azure appliance please refer to the Azure Quick Start Guide.

GOOGLE CLOUD PLATFORM
For details of deploying and configuring the Google Cloud appliance please refer to the GCP Quick Start Guide.
8. Configuring Initial Network Settings

After power up, the following startup message is displayed on the appliance console:

Welcome to the Loadbalancer.org appliance.
To perform initial network configuration, log in to the console as
Username: setup
Password: setup
To access the web interface and wizard, point your browser at
http://192.168.2.21:9880/
or
https://192.168.2.21:9443/
lbmaster login: _

As mentioned in the text, initial network settings are configured using the Network Setup Wizard. The wizard starts automatically when you login as the 'setup' user at the appliance console.

Login to the console:

Username: setup
Password: setup

A series of screens will be displayed that allow network settings to be configured:

To continue with the Network Setup Wizard select Yes and hit <ENTER> to continue.
Configuring Initial Network Settings

A list of available interfaces will be shown, hit <ENTER> to continue.

Select **Yes** if you want to configure a bonded interface, if not leave **No** selected, then hit <ENTER> to continue.

If you select **Yes**, the screen shown below will be displayed:

Using the space bar, select the interfaces you’d like to include in the bond, then click **Create**.
Configuring Initial Network Settings

Select **Yes** if you want to configure a VLAN, if not leave **No** selected, then hit <ENTER> to continue.

If you select **Yes** you’ll be prompted to enter a VLAN Tag ID for the new VLAN.

Select the interface that will be used to manage the appliance, select **Select** and hit <ENTER> to continue.

Enter the required management IP address and CIDR prefix, select **Done** and hit <ENTER> to continue.

**NOTE:** a subnet mask such as 255.255.255.0 is not valid, in this case enter 24 instead.

Enter the default gateway address, select **Done** and hit <ENTER> to continue.
Define the required DNS server(s), select **Done** and hit <ENTER> to continue.

A summary of all settings is displayed, if everything looks good hit <ENTER> to continue, all settings will then be applied.

Hit <ENTER> to continue

Enter the password you’d like to use for the ‘loadbalancer’ WebUI user account and the ‘root’ Linux user account, select **Done** and hit <ENTER> to continue.
9. Accessing the Web User Interface (WebUI)

1. Using a web browser, access the WebUI using the following URL:

   ```
   ```

2. Login to the WebUI:

   **Username:** loadbalancer  
   **Password:** <configured-during-network-setup-wizard>

Once logged in, the WebUI will be displayed as shown below:
Accessing the Web User Interface (WebUI)

The WebUI for the VA is shown. The hardware and cloud appliances are very similar, but have different startup messages (shown yellow above).

3. You’ll be asked if you want to run the Setup Wizard. If you click Accept the Layer 7 Virtual Service configuration wizard will start (please refer to page 15 for details of using the wizard). If you want to configure the appliance manually, simple click Dismiss.

**Main Menu Options:**

- **System Overview** – Displays a graphical summary of all VIPs, RIPS and key appliance statistics
- **Local Configuration** – Configure local host settings such as IP address, DNS, system time etc.
- **Cluster Configuration** – Configure load balanced services such as VIPs & RIPS
- **Maintenance** – Perform maintenance tasks such as service restarts and taking backups
- **View Configuration** – Display the saved appliance configuration settings
- **Reports** – View various appliance reports & graphs
- **Logs** – View various appliance logs
- **Support** – Create a support download, contact the support team & access useful links
10. Ports Used by the Appliance

By default, the appliance uses the following TCP & UDP ports:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>22</td>
<td>SSH</td>
</tr>
<tr>
<td>TCP &amp; UDP</td>
<td>53</td>
<td>DNS</td>
</tr>
<tr>
<td>TCP &amp; UDP</td>
<td>123</td>
<td>NTP</td>
</tr>
<tr>
<td>TCP &amp; UDP</td>
<td>161</td>
<td>SNMP</td>
</tr>
<tr>
<td>UDP</td>
<td>6694</td>
<td>Heartbeat between master &amp; slave appliances in HA mode</td>
</tr>
<tr>
<td>TCP</td>
<td>7777</td>
<td>HAPerxy statistics page</td>
</tr>
<tr>
<td>TCP</td>
<td>7778</td>
<td>HAPerxy persistence table replication</td>
</tr>
<tr>
<td>TCP</td>
<td>9080</td>
<td>WebUI – HTTP (disabled by default)</td>
</tr>
<tr>
<td>TCP</td>
<td>9081</td>
<td>Nginx fallback page</td>
</tr>
<tr>
<td>TCP</td>
<td>9443</td>
<td>WebUI – HTTPS</td>
</tr>
</tbody>
</table>

11. Licensing

The trial runs for 30 days and is completely unrestricted during this time. After 30 days, the appliance continues to work but it’s no longer possible to make changes to the configuration. If you need more time to complete your evaluation, please contact sales@loadbalancer.org who will be able to provide guidance on how to extend the trial using a simple command.

When a license is purchased, you’ll be provided with a license key file by our sales team. You can then simply apply this license to your appliance.

To install the license:

1. Using the WebUI, navigate to: Local Configuration > License Key
2. Browse to the license file provided when the appliance was purchased
3. Click Install License Key

12. Software Updates

Loadbalancer.org continually develop and add new and improved features to the appliance. These updates can be applied during the trial to ensure you have the very latest version of our software for your evaluation.

To run Software Update:

1. Using the WebUI, navigate to: Maintenance > Software Update
2. Choose Online Update if the appliance has Internet access
3. If updates are available, you’ll be presented with a list of changes, click the Online Update button at the bottom of the page to start the update
13. Configuring & Testing a Simple Load Balanced Test Environment

This example illustrates how to quickly configure a simple load balanced test environment.

Note:
Layer 7 SNAT mode is used in the example. As mentioned earlier, this mode requires no changes to the Real Servers.

The following table and diagram describe the environment:

<table>
<thead>
<tr>
<th>IP Address</th>
<th>Device</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.1.10</td>
<td>Test Client</td>
<td></td>
</tr>
<tr>
<td>192.168.1.20</td>
<td>Load Balancer</td>
<td>The load balancer’s own IP address</td>
</tr>
<tr>
<td>192.168.1.25</td>
<td>Load Balancer</td>
<td>The Virtual IP address (VIP), i.e. the IP address clients connect to</td>
</tr>
<tr>
<td>192.168.1.30</td>
<td>Web Server 1</td>
<td></td>
</tr>
<tr>
<td>192.168.1.40</td>
<td>Web Server 2</td>
<td></td>
</tr>
</tbody>
</table>

STEP 1 – DEPLOY THE APPLIANCE

• Please refer to page 7

STEP 2 – RUN THE NETWORK SETUP WIZARD

• Please refer to page 8

STEP 3 – RUN THE WEBUI SETUP WIZARD

1. Open the WebUI and start the wizard by clicking the Accept button, or by using the WebUI menu option: Cluster Configuration > Setup Wizard and clicking General Layer 7 Virtual Service

Note:
If your appliance does not have Internet access, please contact support@loadbalancer.org for details of how to obtain the offline update files.
2. Define the required Virtual Service settings as shown in the example below:

```
<table>
<thead>
<tr>
<th>Load balancer configuration</th>
<th>Master</th>
<th>Slave</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Static IP Addresses</td>
<td>eth0</td>
<td></td>
</tr>
<tr>
<td>Floating IP Addresses</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

3. Click **Create Virtual Service**

4. Now continue and add the associated load balanced servers (Real Servers) as shown below:

```
<table>
<thead>
<tr>
<th>Label</th>
<th>IP Address</th>
<th>Port</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web1</td>
<td>192.168.1.30</td>
<td>80</td>
<td>100</td>
</tr>
<tr>
<td>Web2</td>
<td>192.168.1.40</td>
<td>80</td>
<td>100</td>
</tr>
</tbody>
</table>
```

- Use the **Add Real Server** button to define additional Real Servers and use the red cross to delete Real Servers
- Once you’re happy, click **Attach Real Servers** to create the new Virtual Service & Real Servers
- A confirmation message will be displayed as shown in the example below:
5. Click **Continue**

6. Finally, reload HAProxy using the **Reload HAProxy** button in the blue box at the top of the screen or by using the WebUI menu option: **Maintenance > Restart Services** and clicking **Reload HAProxy**

**Note:**
Running the wizard again will permit additional Layer 7 VIPs and associated RIPS to be defined.

**Note:**
To restore manufacturer's settings use the WebUI menu option: **Maintenance > Backup & Restore > Restore Manufacturer's Defaults**. Once restored, at the console login as the setup user to restart the Network Setup Wizard.

**Note:**
By default, Real Server health-checks are set to use a TCP port connect. If you need a more robust check, this can be changed by modifying the configuration as explained below. Please refer to the [Administration Manual (page 209)](#) for more information on configuring health-checks.

### STEP 4 – VIEWING & MODIFYING THE CONFIGURATION

1. The VIP created by the wizard can be seen using the WebUI menu option: **Cluster Configuration > Layer 7 – Virtual Services** as shown below:

   ![Layer 7 Virtual Services](image)

2. Clicking the **Modify** button allows all VIP setting to be modified

3. If changes are made, click the **Update** button to save the changes, then use the **Reload HAProxy** button at the top of the screen to apply the changes

4. Additional VIPs can be added by running the Setup Wizard again, or by clicking the **Add a new Virtual Service** button to define the VIP manually
STEP 5 – CHECKING THE STATUS USING SYSTEM OVERVIEW

1. Using the WebUI, navigate to: System Overview to view the newly created VIP & RIPs:

   ![System Overview](image)

2. To view the RIPs, click anywhere on the horizontal gray area to expand the VIP as shown below:

   ![Expanded VIP](image)

STEP 6 – VERIFICATION & TESTING

1. Verify that both Real Servers are up. In the example below, Web2 is failing its health-check:

   ![Real Servers](image)

   - This should be investigated and corrected, possible steps include:
     - Check that the application/service is running on the Real Server
     - Make sure you can ping the Real Server from the load balancer
     - Verify that you can connect to the application port from the load balancer. This can be done using telnet at the console or via an SSH session:
       ```
telnet 192.168.1.40 80
       ```

2. Once both servers are up (shown green) browse to the VIP address and verify that you see the web page from each Real Server:

   - Halt Web1 using the Halt option for Web1 in the System Overview and verify that content is served by Web2 on a browser refresh (CTRL-F5)
   - Halt Web2 using the Halt option for Web2 in the System Overview and verify that content is served by Web1 on a browser refresh (CTRL-F5)
14. Configuring HA – Adding a Slave Appliance

As mentioned earlier, our recommended configuration is to use a clustered HA pair of load balancers to provide a highly available and resilient load balancing solution. We recommend that the master is fully configured first, then the slave should be added. The clustered HA pair uses Heartbeat to determine the state of the other appliance. Should the active device (normally the master) suffer a failure, the passive device (normally the slave) will take over.

To add a slave node – i.e. create a highly available clustered pair:

1. Deploy a second appliance that will be the slave and configure initial network settings
2. Using the WebUI, navigate to: Cluster Configuration > High-Availability Configuration

![CREATE A CLUSTERED PAIR](image.png)

3. Specify the IP address and the loadbalancer users password (the default is ‘loadbalancer’) for the slave (peer) appliance as shown above
4. Click Add new node
5. The pairing process now commences as shown below:
6. Once complete, the following will be displayed:

![Create a Clustered Pair](image)

7. To finalize the configuration, restart heartbeat and any other services as prompted in the blue message box at the top of the screen.

**Note:**
Clicking the Restart Heartbeat button on the master appliance will also automatically restart heartbeat on the slave appliance.

**Note:**
Please refer to the Administration Manual (page 229-242) for more detailed information on configuring HA with 2 appliances.

**15. More Information**

Please refer to our website for the latest administration manual, deployment guides and all other documentation: [https://www.loadbalancer.org/support/manuals/](https://www.loadbalancer.org/support/manuals/).

**16. Loadbalancer.org Technical Support**

If you have any questions regarding the appliance or how to load balance your application, please don’t hesitate to contact our support team using the following email address: support@loadbalancer.org.
# 17. Company Contact Information
