1. About this Guide

This quick start guide provides enough information to deploy the appliance, configure a simple load balanced test environment and test and verify its functionality.

Note Please also refer to the Administration Manual for much more detailed information on setting up the appliance and configuring a load balancing solution. For information on configuring the appliance for specific applications, please refer to our extensive library of Deployment Guides.

2. Appliance Configuration Overview

Initial network configuration is carried out at the console using the Network Setup Wizard. Once an IP address has been allocated, load balanced services can be configured using the WebUI; either using the Setup Wizard (for Layer 7 services) or by manually defining the Virtual Services (VIPs) and associated Real Servers (RIPs).

By default, the WebUI is accessible on HTTPS port 9443. HTTP access on port 9080 can also be enabled if required - please refer to the "Appliance Security" section below.

We always recommend that where possible two appliances are deployed as a clustered pair for high availability and resilience, this avoids introducing a single point of failure to your network.

We recommend that the Primary is fully configured first, then the Secondary should be added. Once a pair is configured, load balanced services must be configured & modified on the Primary appliance. The Secondary appliance will then be kept in sync automatically. More information on configuring an HA pair can be found in the section Configuring HA - Adding a Secondary Appliance.

3. Appliance Security

Security Mode

To control how the appliance is accessed and which features are enabled, 3 security modes are provided:

- **Secure** - this is the default mode. In this mode:
  - the WebUI is accessible on HTTPS port 9443. If you attempt to access the WebUI on HTTP port 9080 you will be redirected to HTTPS port 9443
  - access to the Local Configuration > Execute shell command menu option is disabled
  - the ability to edit the firewall script & the lockdown wizard is disabled
  - 'root' user console & SSH password access are disabled
- **Custom** - In this mode, the security options can be configured to suit your requirements
- **Secure - Permanent** - this mode is the same as Secure but the change is irreversible

**Important** Only set the security mode to Secure - Permanent if you are 100% sure this is what you want!

To configure the Security Mode:

1. Using the WebUI, navigate to: Local Configuration > Security.
2. Select the required **Appliance Security Mode**.

3. If **Custom** is selected, configure the additional options according to your requirements.

4. Click **Update**.

   **Note** For more information on configuring appliance security, please refer to **Appliance Security Options**.

**Passwords**

The password for the ‘**loadbalancer**’ WebUI user account and the ‘**root**’ Linux user account are set during the Network Setup Wizard. These can also be changed at any time as explained below:

1 - the ‘**root**’ Linux account:

As explained above, ‘**root**’ user console & SSH password access are disabled by default. If enabled, the ‘**root**’ password should be changed at the console, or via an SSH session using the following command:

```
# passwd
```

**Note**

For the AWS and Azure cloud products it’s not possible to directly login as root. If root access is required, once you’ve logged into the console/SSH session using the credentials defined during instance deployment, run the following command:

```
$ sudo su
```

2 - the ‘**loadbalancer**’ WebUI account:

This can be changed using the WebUI menu option: **Maintenance > Passwords**.

**Security Lockdown Script**

The appliance also includes a security lockdown command (lbsecure) that enables passwords to be set, network access to be locked down and SSH key regeneration in one simple step. This command can be run on a single appliance or an HA pair. For more information please refer to **Appliance Security Lockdown Script**.

**4. Deployment Concept**

Once deployed, clients connect to the Virtual Service(s) (VIPs) on the load balancer rather than connecting directly to one of the load balanced servers. These connections are then distributed between the load balanced servers according to the load balancing algorithm selected.
We always recommend that 2 appliances are deployed as an active/passive HA pair. The Secondary appliance automatically takes over if the Primary unit fails. For more information on configuring HA using 2 appliances please refer to Configuring HA - Adding a Secondary Appliance.

5. One-Arm and Two-Arm Topologies

The number of 'arms' is a descriptive term for how many interfaces are used to connect a device to a network. It’s common for a load balancer that uses a routing method (NAT) to have a two-arm configuration. Proxy based load balancers (SNAT) commonly use a one-arm configuration.

One-Arm

In this mode, the VIP and the load balanced servers are located in a single subnet. The load balancer requires a single network interface adapter - eth0 in the diagram below.

Two-Arm

In this mode, 2 subnets are used. The VIP is located in one subnet and the load balanced servers are located in the other subnet. The load balancer requires 2 interfaces - eth0 and eth1 in the diagram below. Note that this can be achieved by using two network adapters, or by creating VLANs on a single adapter.
6. Supported Load Balancing Methods

The Loadbalancer.org appliance is one of the most flexible load balancers available. The design allows different load balancing modules to utilize the core high availability framework of the appliance. Multiple load balancing methods can be used at the same time or in combination with each other. The table below describes the methods supported by the appliance.

<table>
<thead>
<tr>
<th>Layer</th>
<th>Method</th>
<th>Comments</th>
<th>Topology</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer 4</td>
<td>DR (Direct Routing)</td>
<td>Ultra-fast local server based load balancing</td>
<td>One-Arm (*)</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Requires solving the 'ARP Problem' on the Real Servers - for more details about the ARP problem please refer to DR Mode Considerations.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Layer 4</td>
<td>NAT (Network Address Translation)</td>
<td>Fast Layer 4 load balancing</td>
<td>One or Two-Arm</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The appliance must be the default gateway for the Real Servers</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Layer 4</td>
<td>TUN</td>
<td>Similar to DR but works across IP encapsulated tunnels</td>
<td>One-Arm</td>
<td>2</td>
</tr>
<tr>
<td>Layer 4</td>
<td>SNAT (Source Network Address Translation)</td>
<td>Fast layer 4 SNAT supporting both TCP &amp; UDP</td>
<td>One or Two-Arm</td>
<td>3</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Requires no Real Server changes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Layer 7</td>
<td>SSL Termination (Pound &amp; STunnel)</td>
<td>Usually required in order to process cookie persistence in HTTPS streams on the load balancer</td>
<td>One or Two-Arm</td>
<td>4</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SSL Termination is processor intensive</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Layer</td>
<td>Method</td>
<td>Comments</td>
<td>Topology</td>
<td>Note</td>
</tr>
<tr>
<td>--------</td>
<td>------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------</td>
<td>------</td>
</tr>
<tr>
<td>Layer 7</td>
<td><strong>SNAT (Source Network Address Translation using HAProxy)</strong></td>
<td>Layer 7 allows greater flexibility including full SNAT and remote server load balancing, cookie insertion and URL switching</td>
<td>One or Two-Arm</td>
<td>4</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Very simple to implement</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Requires no Real Server changes</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Not as fast as Layer 4 methods</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(*) DR mode can also be used in a multi-homed configuration where real servers are located in different subnets. In this case, the load balancer must have an interface in the same subnet to enable layer 2 connectivity which is required for DR mode to operate.

**Notes**

1. Recommended for high performance fully transparent and scalable solutions.
2. Only required for Direct Routing implementation across routed networks (rarely used).
3. Recommended when you want to load balance both TCP and UDP but you’re unable to use DR mode or NAT mode due to network topology or Real Server related reasons.
4. Recommended if HTTP cookie persistence is required, also used for several Microsoft applications such as Exchange, Sharepoint & Remote Desktop Services and for overall deployment simplicity since real servers can be on any accessible subnet and no Real-Server changes are required.

**7. Appliance Deployment**

**Virtual Appliance**

A fully featured, fully supported 30 day trial is available if you are conducting a PoC (Proof of Concept) deployment. The VA is currently available for VMware, Virtual Box, Hyper-V, KVM, XEN and Nutanix AHV and has been optimized for each Hypervisor. By default, the VA is allocated 2 vCPUs, 4GB of RAM and has a 20GB virtual disk. The Virtual Appliance can be downloaded [here](#).

**Note**
The same download is used for the licensed product, the only difference is that a license key file (supplied by our sales team when the product is purchased) must be applied using the appliance’s WebUI.

**Note**
Please refer to [The Virtual Appliance - Hypervisor Deployment](#) and the ReadMe.txt text file included in the VA download for more detailed information on deploying the VA using various Hypervisors.

**Note**
For the VA, 4 NICs are included but only eth0 is connected by default at power up. If the other NICs are required, these should be connected using the network configuration screen within the Hypervisor.
Hardware Appliance
For details of all hardware models and for information on installing and connecting the appliance, please click here.

Cloud Appliance
AWS
For details of deploying and configuring the Amazon Web Services (AWS) appliance please refer to the AWS Quick Start Guide.

Azure
For details of deploying and configuring the Microsoft Azure appliance please refer to the Azure Quick Start Guide.

Google Cloud Platform
For details of deploying and configuring the Google Cloud appliance please refer to the GCP Quick Start Guide.

8. Configuring Initial Network Settings
After power up, the following startup message is displayed on the appliance console:

```
Welcome to the Loadbalancer.org appliance.
To perform initial network configuration, log in to the console as
Username: setup
Password: setup

To access the web interface and wizard, point your browser at
http://192.168.21:9888/
or
https://192.168.21:9443/
```

As mentioned in the text, initial network settings are configured using the Network Setup Wizard. The wizard starts automatically when you login as the 'setup' user at the appliance console.

login to the console:

**Username:** setup
**Password:** setup

A series of screens will be displayed that allow network settings to be configured:
To continue with the Network Setup Wizard select Yes and hit <ENTER> to continue.

A list of available interfaces will be shown, hit <ENTER> to continue.

Select Yes if you want to configure a bonded interface, if not leave No selected, then hit <ENTER> to continue.

If you select Yes, the screen shown below will be displayed:

Using the space bar, select the interfaces you’d like to include in the bond, then click Create.
Select **Yes** if you want to configure a VLAN, if not leave **No** selected, then hit <ENTER> to continue.

If you select **Yes** you'll be prompted to enter a VLAN Tag ID.

Select the interface that will be used to manage the appliance, select **Select** and hit <ENTER> to continue.

Either enter the required management IP address & CIDR prefix and select **Done** or select **Use DHCP** to request an address and then hit <ENTER> to continue.

Note: A subnet mask such as 255.255.255.0 is not valid, in this case enter 24 instead.

Enter the default gateway address or, select **Done** and hit <ENTER> to continue.

Define the required DNS server(s), select **Done** and hit <ENTER> to continue.
A summary of all settings is displayed, if everything looks good hit <ENTER> to continue, all settings will then be applied.

Hit <ENTER> to continue.

Enter the password you’d like to use for the ‘loadbalancer’ WebUI user account and the ‘root’ Linux user account, select Done and hit <ENTER> to continue.
At this stage you'll be asked if you're recovering from node (i.e. Primary or Secondary) failure.

If you’re simply deploying a new appliance, select No and hit <ENTER> to continue.

For More details on node recovery using this option please refer to Disaster Recovery After Node (Primary or Secondary) Failure.

9. Accessing the WebUI

The WebUI is accessed using a web browser. Appliance authentication is based on Apache .htaccess files. User admin tasks such as adding users and changing passwords can be performed using the WebUI menu option: Maintenance > Passwords.

Note

A number of compatibility issues have been found with various versions of Internet Explorer and Edge. The WebUI has been tested and verified using both Chrome & Firefox.

Note

If required, users can also be authenticated against LDAP, LDAPS, Active Directory or Radius. For more information please refer to External Authentication.

1. Using a browser, access the WebUI using the following URL:

2. Log in to the WebUI:

   Username: loadbalancer
   Password: <configured-during-network-setup-wizard>

   Note
   To change the password, use the WebUI menu option: Maintenance > Passwords.

Once logged in, the WebUI will be displayed as shown below:
Note: The WebUI for the VA is shown, the hardware and cloud appliances are very similar. The yellow licensing related message is platform & model dependent.

3. You'll be asked if you want to run the Setup Wizard. If you click Accept the Layer 7 Virtual Service configuration wizard will start. If you want to configure the appliance manually, simple click Dismiss.

Main Menu Options

System Overview - Displays a graphical summary of all VIPs, RIPS and key appliance statistics
Local Configuration - Configure local host settings such as IP address, DNS, system time etc.
Cluster Configuration - Configure load balanced services such as VIPs & RIPS
Maintenance - Perform maintenance tasks such as service restarts and taking backups
View Configuration - Display the saved appliance configuration settings
Reports - View various appliance reports & graphs

© Copyright Loadbalancer.org • Documentation • Appliance Quick Start Guide
10. Ports Used by the Appliance

By default, the appliance uses the following TCP & UDP ports:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>22</td>
<td>SSH</td>
</tr>
<tr>
<td>TCP &amp; UDP</td>
<td>53</td>
<td>DNS</td>
</tr>
<tr>
<td>TCP &amp; UDP</td>
<td>123</td>
<td>NTP</td>
</tr>
<tr>
<td>TCP &amp; UDP</td>
<td>161</td>
<td>SNMP</td>
</tr>
<tr>
<td>UDP</td>
<td>6694</td>
<td>Heartbeat between Primary &amp; Secondary appliances in HA mode</td>
</tr>
<tr>
<td>TCP</td>
<td>7778</td>
<td>HAProxy persistence table replication</td>
</tr>
<tr>
<td>TCP</td>
<td>9080</td>
<td>WebUI - HTTP (disabled by default)</td>
</tr>
<tr>
<td>TCP</td>
<td>9081</td>
<td>Nginx fallback page</td>
</tr>
<tr>
<td>TCP</td>
<td>9443</td>
<td>WebUI - HTTPS</td>
</tr>
</tbody>
</table>

11. Licensing

The trial runs for 30 days and is completely unrestricted during this time. After 30 days, the appliance continues to work but it’s no longer possible to make changes to the configuration. If you need more time to complete your evaluation, please contact sales@loadbalancer.org who will be able to provide guidance on how to extent the trial using a simple command.

When a license is purchased, you’ll be provided with a license key file by our sales team. You can then simply apply this license to your appliance.

To install the license:

1. Using the WebUI, navigate to: Local Configuration > License Key.
2. Browse to the license file provided when the appliance was purchased.
3. Click Install License Key.

12. Software Updates

Loadbalancer.org continually develop and add new and improved features to the appliance. These updates can be applied during the trial to ensure you have the very latest version of our software for your evaluation.

To Check for Software Updates:

1. Using the WebUI, navigate to: Maintenance > Software Update.
2. Choose Online Update if the appliance has Internet access.
3. If updates are available, you’ll be presented with a list of changes, click the **Online Update** button at the bottom of the page to start the update.

**Note**
If your appliance does not have Internet access, please contact [support@loadbalancer.org](mailto:support@loadbalancer.org) for details of how to obtain the offline update files.

13. Configuring & Testing a Simple Load Balanced Test Environment

This example illustrates how to quickly configure a simple load balanced test environment using the Network Setup Wizard at the console to configure network settings, and the Setup Wizard from the WebUI to configure the layer 7 virtual service.

**Note**
Layer 7 SNAT mode is used in the example. As mentioned earlier, this is not the fastest mode but is very simple to deploy and requires no changes to the Real Servers.

The following diagram and table describe the environment:

<table>
<thead>
<tr>
<th>IP Address</th>
<th>Device</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.1.10</td>
<td>Test Client</td>
<td></td>
</tr>
<tr>
<td>192.168.1.20</td>
<td>Load Balancer</td>
<td>the load balancers own IP address</td>
</tr>
<tr>
<td>192.168.1.25</td>
<td>Load Balancer</td>
<td>the Virtual IP address (VIP), the IP address the clients connect to</td>
</tr>
<tr>
<td>192.168.1.30</td>
<td>Web Server 1</td>
<td></td>
</tr>
<tr>
<td>192.168.1.40</td>
<td>Web Server 2</td>
<td></td>
</tr>
</tbody>
</table>

**STEP 1 - Deploy the Appliance**
Please refer to [Appliance Deployment](#).

**STEP 2 - Run the Network Setup Wizard**
Please refer to [Configuring Initial Network Settings](#).

**STEP 3 - Run the WebUI Setup Wizard**

1. Open the WebUI and start the wizard by clicking the **Accept** button, or by using the WebUI menu option: **Cluster Configuration > Setup Wizard** and clicking **General Layer 7 Virtual Service**.
2. Define the required Virtual Service settings as shown in the example below:

![Setup Wizard - General Layer 7 Virtual Service](image)

Create a new Layer 7 Virtual Service

- **Label**: Web-Cluster
- **IP Address**: 192.168.1.25
- **Port**: 80
- **Layer 7 Protocol**: TCP Mode

Create Virtual Service

Select the Layer 7 protocol to be handled by this Virtual Service. Advanced options may be set by editing this Virtual Service once it has been created.

3. Click Create Virtual Service.

4. Now continue and add the associated load balanced servers (Real Servers) as shown below:

![Attach Real Servers](image)

- **Label**: Web1
  - **IP Address**: 192.168.1.30
  - **Port**: 80
  - **Weight**: 100

- **Label**: Web2
  - **IP Address**: 192.168.1.40
  - **Port**: 80
  - **Weight**: 100

- **Use the Add Real Server button to define additional Real Servers and use the red cross to delete Real Servers.**
- **Once you’re happy, click Attach Real Servers to create the new Virtual Service & Real Servers.**
- **A confirmation message will be displayed as shown in the example below:**
d. Click **Continue**.

5. Finally, reload HAProxy using the **Reload HAProxy** button in the blue box at the top of the screen or by using the WebUI menu option: **Maintenance > Restart Services** and clicking **Reload HAProxy**.

Note: Running the wizard again will permit additional Layer 7 VIPs and associated RIPS to be defined.

Note: To restore manufacturer’s settings use the WebUI menu option: **Maintenance > Backup & Restore > Restore Manufacturer’s Defaults**. This will reset the IP address to 192.168.2.21/24.

Note: By default, Real Server health-checks are set to use a TCP port connect. If you need a more robust check, this can be changed by modifying the configuration as explained below. For more information, please refer to **Real Server Health Monitoring & Control**.

### STEP 4 - Viewing & Modifying the Configuration

1. The VIP created by the wizard can be seen using the WebUI menu option: **Cluster Configuration > Layer 7 - Virtual Services** as shown below:

   ![Layer 7 - Virtual Services](image)

<table>
<thead>
<tr>
<th>Service Name</th>
<th>IP</th>
<th>Port</th>
<th>Config Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test-VIP</td>
<td>192.168.125</td>
<td>Ports 80</td>
<td>Auto</td>
</tr>
</tbody>
</table>

   2. Clicking the **Modify** button allows all VIP setting to be modified.

   3. If changes are made, click the **Update** button to save the changes, then use the **Reload HAProxy** button at the top of the screen to apply the changes.

   4. Additional VIPs can be added by running the Setup Wizard again, or by clicking the **Add a new Virtual Service** button to define the VIP manually.

   Note: Real Servers can be added manually using the WebUI menu option: **Cluster Configuration > Layer 7 - Real Servers**.

### STEP 5 - Checking the Status using System Overview

1. Using the WebUI, navigate to: **System Overview** to view the newly created VIP & RIPS:
2. To view the RIPS, click anywhere on the horizontal gray area to expand the VIP as shown below:

### STEP 6 - Verification & Testing

1. Verify that both Real Servers are up. In the example below, Web2 is failing its health-check:

- This should be investigated and corrected, possible steps include:
  - Check that the application/service is running on the Real Server
  - Make sure you can ping the Real Server from the load balancer
  - Verify that you can connect to the application port from the load balancer. This can be done using `telnet` at the console or via an SSH session:

  ```
telnet 192.168.1.40 80
  ```

2. Once both servers are up (shown green) browse to the VIP address and verify that you see the web page from each Real Server:

   - Halt Web1 using the `Halt` option for Web1 in the System Overview and verify that content is served by Web2 on a browser refresh (CTRL-F5)
   - Halt Web2 using the `Halt` option for Web2 in the System Overview and verify that content is served by Web1 on a browser refresh (CTRL-F5)

**Note**

For more configuration examples using Layer 7 SNAT mode and also Layer 4 DR mode, Layer 4 NAT mode & Layer 4 SNAT mode, please refer to [Configuration Examples](#).

**Note**

For more information on verifying your test environment and for ways to diagnose any issues you may have, please refer to [Testing Load Balanced Services](#).
14. Configuring HA - Adding a Secondary Appliance

Our recommended configuration is to use a clustered HA pair of load balancers to provide a highly available and resilient load balancing solution.

We recommend that the Primary appliance should be configured first, then the Secondary should be added. Once the Primary and Secondary are paired, all load balanced services configured on the Primary are automatically replicated to the Secondary over the network using SSH/SCP.

Note: For Enterprise Azure, the HA pair should be configured first. In Azure, when creating a VIP using an HA pair, 2 private IPs must be specified – one for the VIP when it’s active on the Primary and one for the VIP when it’s active on the Secondary. Configuring the HA pair first, enables both IPs to be specified when the VIP is created.

The clustered HA pair uses Heartbeat to determine the state of the other appliance. Should the active device (normally the Primary) suffer a failure, the passive device (normally the Secondary) will take over.

Note: A number of settings are not replicated as part of the Primary/Secondary pairing process and therefore must be manually configured on the Secondary appliance. These are listed by WebUI menu option in the table below:

<table>
<thead>
<tr>
<th>WebUI Main Menu Option</th>
<th>Sub Menu Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Configuration</td>
<td>Hostname &amp; DNS</td>
<td>Hostname and DNS settings</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>Network Interface Configuration</td>
<td>All network settings including IP address(es), bonding configuration and VLANs</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>Routing</td>
<td>Routing configuration including default gateways and static routes</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>System Date &amp; time</td>
<td>All time and date related settings</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>Physical – Advanced Configuration</td>
<td>Various settings including Internet Proxy, Management Gateway, Firewall connection tracking table size, NIC offloading, SMTP relay, logging and Syslog Server</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>Security</td>
<td>Appliance security settings</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>SNMP Configuration</td>
<td>Appliance SNMP settings</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>Graphing</td>
<td>Appliance graphing settings</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>License Key</td>
<td>Appliance licensing</td>
</tr>
<tr>
<td>Maintenance</td>
<td>Software Updates</td>
<td>Appliance software update management</td>
</tr>
<tr>
<td>Maintenance</td>
<td>Firewall Script</td>
<td>Appliance firewall (iptables) configuration</td>
</tr>
<tr>
<td>Maintenance</td>
<td>Firewall Lockdown Wizard</td>
<td>Appliance management lockdown settings</td>
</tr>
</tbody>
</table>

To add a Secondary node - i.e. create a highly available clustered pair:

1. Deploy a second appliance that will be the Secondary and configure initial network settings.
2. Using the WebUI, navigate to: Cluster Configuration > High-Availability Configuration.

3. Specify the IP address and the loadbalancer user’s password for the Secondary (peer) appliance as shown above.

4. Click Add new node.

5. The pairing process now commences as shown below:

6. Once complete, the following will be displayed:

7. To finalize the configuration, restart heartbeat and any other services as prompted in the blue message box at the top of the screen.
Clicking the **Restart Heartbeat** button on the Primary appliance will also automatically restart heartbeat on the Secondary appliance.

For more details on configuring HA with 2 appliances, please refer to [Appliance Clustering for HA](#).

### 15. More Information

Please refer to our website for all the latest [Manuals](#) and [Deployment Guides](#).

### 16. Loadbalancer.org Technical Support

If you have any questions regarding the appliance or need assistance with load balancing your application, please don’t hesitate to contact our support team using the following email address: support@loadbalancer.org.
About Loadbalancer.org

Loadbalancer.org's mission is to ensure that its clients' businesses are never interrupted. The load balancer experts ask the right questions to get to the heart of what matters, bringing a depth of understanding to each deployment. Experience enables Loadbalancer.org engineers to design less complex, unbreakable solutions - and to provide exceptional personalized support.
