# 1. About this Brief

This brief outlines the steps required to configure a load balanced Boomi Blueprint environment utilizing Loadbalancer.org appliances. It covers the configuration of the load balancers and also any Boomi Blueprint configuration changes that are required to enable load balancing.

For more information about initial appliance deployment, network configuration and using the Web User Interface (WebUI), please also refer to the [Administration Manual](#).

## 2. Loadbalancer.org Appliances Supported

All our products can be used with Boomi Blueprint. For full specifications of available models please refer to <https://www.loadbalancer.org/products>.

Some features may not be available or fully supported in all cloud platforms due to platform specific limitations. For more details, please refer to the "Main Differences to our Standard (Non-Cloud) Product" section in the appropriate cloud platform [Quick Start Guide](#) or check with Loadbalancer.org support.

## 3. Software Versions Supported

### 3.1. Loadbalancer.org Appliance

- V8.9.1 and later

#### Note

The screenshots used throughout this document aim to track the latest Loadbalancer.org software version. If you're using an older version, or the very latest, the screenshots presented here may not match your WebUI exactly.

### 3.2. Boomi Blueprint

- All versions

## 4. Boomi Blueprint

Boomi Blueprint is a framework developed by Boomi, an iPaaS provider. It helps organizations plan, implement, and manage their integration and automation strategies effectively.

## 5. Load Balancing Boomi Blueprint

#### Note

It's highly recommended that you have a working Boomi Blueprint environment first before implementing the load balancer.

### 5.1. Virtual Service (VIP) Requirements

To provide load balancing and HA for Boomi Blueprint, the following VIPs are required:

Ref.	VIP Name	Mode	Port(s)	Persistence Mode	Health Check
VIP 1	Molecule	L7 SNAT	80	None	HTTP (GET)
VIP 2	APIManagement	L7 SNAT	80	Source IP	HTTP (GET)

## 5.2. TLS/SSL Termination

SSL Termination is configured on the load balancer for the following VIPs:

- VIP1 - **Molecule**
- VIP2 - **APIManagement**

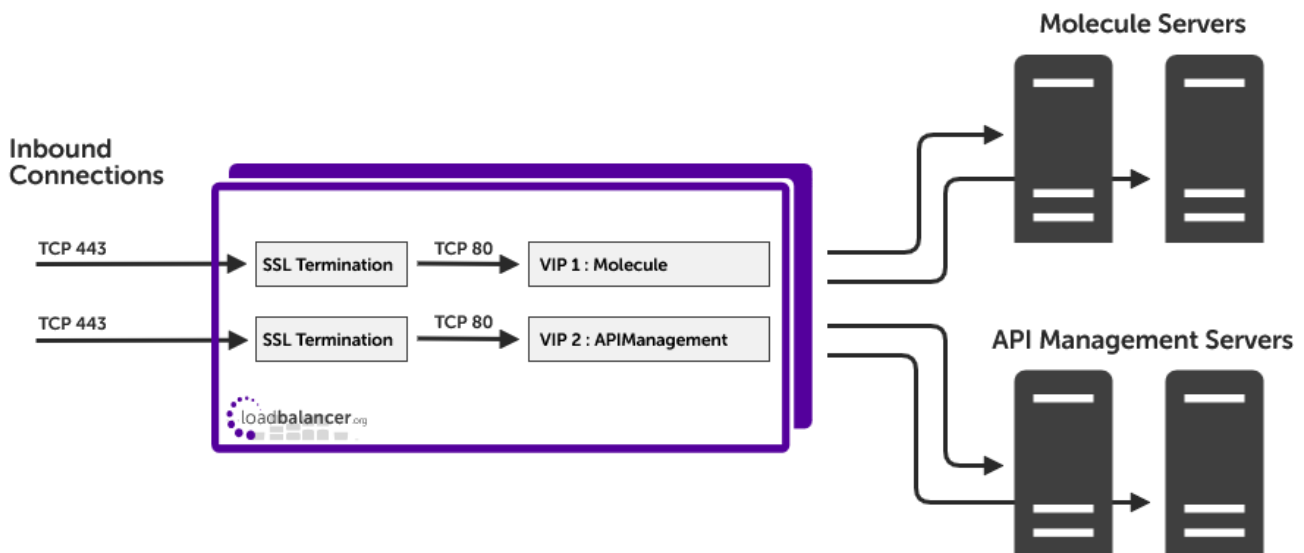

This provides a corresponding HTTPS Virtual Service for these VIPs. Certificates in PEM or PFX format can be uploaded to the load balancer.

### Note

If from a security perspective this is not desirable, then **SSL Passthrough** or **SSL Bridging** can be used rather than SSL termination. This would ensure that traffic from the load balancer to the Boomi Blueprint servers is also encrypted. If you require assistance to configure this, please contact support.

## 6. Deployment Concept

Once the load balancer is deployed, clients connect to the Virtual Services (VIPs) rather than connecting directly to one of the Boomi Blueprint servers. These connections are then load balanced across the Boomi Blueprint servers to distribute the load according to the load balancing algorithm selected.

### Note

The load balancer can be deployed as a single unit, although Loadbalancer.org recommends a clustered pair for resilience & high availability. Please refer to the section [Configuring HA - Adding a Secondary Appliance](#) in the appendix for more details on configuring a clustered pair.

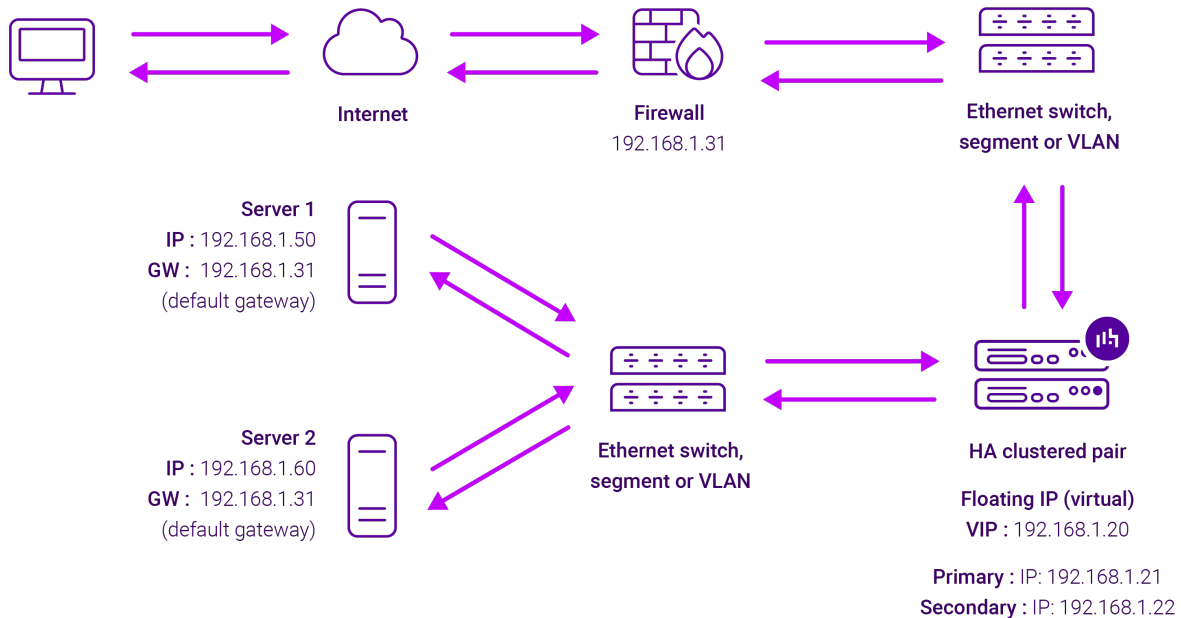

# 7. Load Balancer Deployment Methods

The load balancer can be deployed in 4 fundamental ways: *Layer 4 DR mode*, *Layer 4 NAT mode*, *Layer 4 SNAT mode*, and *Layer 7 SNAT mode*.

For Boomi Blueprint, layer 7 SNAT mode is recommended. This mode is described below and is used for the configuration presented in this guide.

## 7.1. Layer 7 SNAT Mode

Layer 7 SNAT mode uses a proxy (HAProxy) at the application layer. Inbound requests are terminated on the load balancer and HAProxy generates a new corresponding request to the chosen Real Server. As a result, Layer 7 is typically not as fast as the Layer 4 methods. Layer 7 is typically chosen when either enhanced options such as SSL termination, cookie based persistence, URL rewriting, header insertion/deletion etc. are required, or when the network topology prohibits the use of the layer 4 methods. The image below shows an example network diagram for this mode.

- Because layer 7 SNAT mode is a full proxy, Real Servers in the cluster can be on any accessible network including across the Internet or WAN.
- Layer 7 SNAT mode is not transparent by default, i.e. the Real Servers will not see the source IP address of the client, they will see the load balancer’s own IP address by default, or any other local appliance IP address if preferred (e.g. the VIP address). This can be configured per layer 7 VIP. If required, the load balancer can be configured to provide the actual client IP address to the Real Servers in 2 ways. Either by inserting a header that contains the client’s source IP address, or by modifying the Source Address field of the IP packets and replacing the IP address of the load balancer with the IP address of the client. For more information on these methods please refer to [Transparency at Layer 7](#).
- Layer 7 SNAT mode can be deployed using either a one-arm or two-arm configuration. For two-arm deployments, **eth1** is typically used for client side connections and **eth0** is used for Real Server connections, although this is not mandatory since any interface can be used for any purpose.

- Requires no mode-specific configuration changes to the load balanced Real Servers.
- Port translation is possible with Layer 7 SNAT mode, e.g. VIP:80 → RIP:8080 is supported.
- You should not use the same RIP:PORT combination for layer 7 SNAT mode VIPs and layer 4 SNAT mode VIPs because the required firewall rules conflict.

## 8. Configuring Boomi Blueprint for Load Balancing

The **Atom Pending Shutdown Delay** (`com.boomi.container.pendingShutdownWarnTime`) should be configured to be twice the load balancer's check interval. As detailed in [Configure the Health Check Interval], the layer 7 check interval is set to 30 seconds, therefore this should be set to 60 seconds as shown below:

## 9. Loadbalancer.org Appliance – the Basics

### 9.1. Virtual Appliance

A fully featured, fully supported 30 day trial is available if you are conducting a PoC (Proof of Concept) deployment. The VA is currently available for VMware, Virtual Box, Hyper-V, KVM, XEN and Nutanix AHV and has been optimized for each Hypervisor. By default, the VA is allocated 2 vCPUs, 4GB of RAM and has a 20GB virtual disk. The Virtual Appliance can be downloaded [here](#).

#### Note

The same download is used for the licensed product, the only difference is that a license key file (supplied by our sales team when the product is purchased) must be applied using the appliance's WebUI.

#### Note

Please refer to [Virtual Appliance Installation](#) and the ReadMe.txt text file included in the VA download for additional information on deploying the VA using the various Hypervisors.

#### Note

The VA has 4 network adapters. For VMware only the first adapter (**eth0**) is connected by default. For HyperV, KVM, XEN and Nutanix AHV all adapters are disconnected by default. Use the network configuration screen within the Hypervisor to connect the required adapters.

### 9.2. Initial Network Configuration

After boot up, follow the instructions on the appliance console to configure the management IP address, subnet mask, default gateway, DNS servers and other network and administrative settings.

#### Important

Be sure to set a secure password for the load balancer, when prompted during the setup routine.

### 9.3. Accessing the Appliance WebUI

The WebUI is accessed using a web browser. By default, users are authenticated using Apache authentication. Users can also be authenticated against LDAP, LDAPS, Active Directory or Radius - for more information, please

refer to [External Authentication](#).

 **Note**

There are certain differences when accessing the WebUI for the cloud appliances. For details, please refer to the relevant [Quick Start / Configuration Guide](#).

1. Using a browser, navigate to the following URL:

**<https://<IP-address-configured-during-the-network-setup-wizard>:9443/lbadmin/>**

 **Note**

You'll receive a warning about the WebUI's SSL certificate. This is due to the default self signed certificate that is used. If preferred, you can upload your own certificate - for more information, please refer to [Appliance Security Features](#).

 **Note**

If you need to change the port, IP address or protocol that the WebUI listens on, please refer to [Service Socket Addresses](#).

2. Log in to the WebUI using the following credentials:

**Username:** loadbalancer

**Password:** <configured-during-network-setup-wizard>

 **Note**

To change the password, use the WebUI menu option: **Maintenance > Passwords**.

Once logged in, the WebUI will be displayed as shown below:

Primary | Secondary    Active | Passive    Link    3 Seconds ↻

- System Overview
- Local Configuration
- Cluster Configuration
- Maintenance
- View Configuration
- Reports
- Logs
- Support
- Live Chat

**WARNING: YOUR TRIAL IS DUE TO EXPIRE IN 30 DAYS.**

Buy with confidence. All purchases come with a 90 day money back guarantee. Already bought? Enter your license key [here](#)

### 9.3.1. Main Menu Options

**System Overview** - Displays a graphical summary of all VIPs, RIPs and key appliance statistics

**Local Configuration** - Configure local host settings such as IP address, DNS, system time etc.

**Cluster Configuration** - Configure load balanced services such as VIPs & RIPs

**Maintenance** - Perform maintenance tasks such as service restarts and creating backups

**View Configuration** - Display the saved appliance configuration settings

**Reports** - View various appliance reports & graphs

**Logs** - View various appliance logs

**Support** - Create a support download, contact the support team & access useful links

**Live Chat** - Start a live chat session with one of our Support Engineers

## 9.4. Appliance Software Update

We recommend that the appliance is kept up to date to ensure that you benefit from the latest bug fixes, security updates and feature improvements. Both online and offline update are supported.

 **Note**

For full details, please refer to [Appliance Software Update](#) in the Administration Manual.

 **Note**

Services may need to be restarted/reloaded after the update process completes or in some cases a full appliance restart may be required. We therefore recommend performing the update during a maintenance window.

### 9.4.1. Online Update

The appliance periodically contacts the Loadbalancer.org update server ([update.loadbalancer.org](https://update.loadbalancer.org)) and checks for updates. This is the default behavior and can be disabled if preferred. If an update is found, a notification similar to the example below will be displayed at the top of the WebUI:

**Information:** Update 8.13.0 is now available for this appliance.

**Online Update**

Click **Online Update**. A summary of all new features, improvements, bug fixes and security updates included in the update will be displayed. Click **Update** at the bottom of the page to start the update process.

 **Important**

Do not navigate away whilst the update is ongoing, this may cause the update to fail.

The update can take several minutes depending on download speed and upgrade version. Once complete, the following message will be displayed:

**Information:** Update completed successfully. Return to **system overview**.

If services need to be reloaded/restarted or the appliance needs a full restart, you'll be prompted accordingly.

### 9.4.2. Offline Update

If the appliance does not have access to the Internet, offline update can be used.

To check for the latest version, please refer to our product roadmap page available [here](#). To obtain the latest offline update files contact [support@loadbalancer.org](mailto:support@loadbalancer.org).

To perform an offline update:

1. Using the WebUI, navigate to: **Maintenance > Software Update**.
2. Select **Offline Update**.
3. The following screen will be displayed:

## Software Update

### Offline Update

The following steps will lead you through offline update.

1. Contact [Loadbalancer.org support](#) to obtain the offline update archive and checksum.
2. Save the archive and checksum to your local machine.
3. Select the archive and checksum files in the upload form below.
4. Click *Upload and Install* to begin the update process.

Archive:  No file chosen

Checksum:  No file chosen

4. Select the *Archive* and *Checksum* files.
5. Click **Upload and Install**.
6. If services need to be reloaded/restarted or the appliance needs a full restart, you'll be prompted accordingly.

## 9.5. Ports Used by the Appliance

By default, the appliance uses the following TCP & UDP ports:

Protocol	Port	Purpose
TCP	22 *	SSH
TCP & UDP	53 *	DNS / GSLB
TCP & UDP	123	NTP
TCP & UDP	161 *	SNMP
UDP	6694	Heartbeat between Primary & Secondary appliances in HA mode
TCP	7778	HAProxy persistence table replication
TCP	9000 *	Gateway service (Centralized/Portal Management)
TCP	9080 *	WebUI - HTTP (disabled by default)
TCP	9081 *	Nginx fallback page
TCP	9443 *	WebUI - HTTPS
TCP	25565 *	Shuttle service (Centralized/Portal Management)

#### Note

The ports used for SSH, GSLB, SNMP, the WebUI, the fallback page, the gateway service and the shuttle service can be changed if required. For more information, please refer to [Service Socket Addresses](#).

## 9.6. HA Clustered Pair Configuration

Loadbalancer.org recommend that load balancer appliances are deployed in pairs for high availability. In this

guide a single unit is deployed first, adding a secondary unit is covered in the section [Configuring HA - Adding a Secondary Appliance](#) of the appendix.

## 10. Appliance Configuration for Boomi Blueprint

### 10.1. Configure the Health Check Interval

1. Using the WebUI, navigate to *Cluster Configuration > Layer 7 - Advanced Configuration*.
2. Set the health check *Interval* to **30000**, i.e. 30 seconds as shown below.

Disable On Start	<input type="checkbox"/>	?
Interval	<input type="text" value="30000"/> ms	?
Rise	<input type="text" value="2"/> checks	?
Fall	<input type="text" value="2"/> checks	?
Slow Start Time	<input type="text" value="8000"/> ms	?

3. Scroll to the bottom of the page and click **Update**.

### 10.2. Upload the SSL Certificate(s)

Certificates in either PEM or PFX format can be uploaded.

1. Using the WebUI, navigate to *Cluster Configuration > SSL Certificate* and click **Add a new SSL Certificate**.
2. Select the option **Upload prepared PEM/PFX file**.
3. Enter the following details:

I would like to:	<input checked="" type="radio"/> Upload prepared PEM/PFX file	?
	<input type="radio"/> Create a new SSL Certificate Signing Request (CSR)	?
	<input type="radio"/> Create a new Self-Signed SSL Certificate.	
Label	<input type="text" value="Boomi-Cert"/>	?
File to upload	<input type="button" value="Choose File"/> certificate.pem	?

4. Specify an appropriate *Label*, e.g. **Boomi-Cert**.
5. Click **Choose File**.
6. Browse to and select the relevant PEM or PFX file.
7. For PFX files specify the password if required.

8. Click **Upload Certificate**.
9. If required, repeat these steps to upload additional certificates.

## 10.3. Configure Virtual Services

### 10.3.1. VIP 1 - Molecule

#### Virtual Service (VIP) Configuration

1. Using the WebUI, navigate to *Cluster Configuration > Layer 7 – Virtual Services* and click on **Add a new Virtual Service**.
2. Enter the following details:

Virtual Service		[Advanced +]
Label	<input type="text" value="Molecule"/>	?
IP Address	<input type="text" value="192.168.1.240"/>	?
Ports	<input type="text" value="80"/>	?
Protocol		[Advanced +]
Layer 7 Protocol	<input type="text" value="HTTP Mode"/>	?

3. Define the *Label* for the virtual service as required, e.g. **Molecule**.
4. Set the *Virtual Service IP Address* field to the required IP address, e.g. **192.168.1.240**.
5. Set the *Ports* field to **80**.
6. Leave the *Layer 7 Protocol* set to **HTTP Mode**.
7. Click **Update** to create the Virtual Service.
8. Now click **Modify** next to the newly created VIP.
9. Scroll to the *Connection Distribution Method* section.
  - Set the *Balance Mode* to **Weighted Round Robin**.
10. Scroll to the *Persistence* section.
  - Ensure that the *Persistence Mode* is set to **None**.
11. Scroll to the *Health Checks* section.
  - Set the *Health Checks* to **Negotiate HTTP (GET)**.
  - Set the *Request to send* to **/\_admin/status**.
12. Leave all other settings at their default value.
13. Click **Update**.

## Configure the Associated Real Servers (RIPs)

1. Using the WebUI, navigate to *Cluster Configuration > Layer 7 – Real Servers* and click on **Add a new Real Server** next to the newly created VIP.
2. Enter the following details:

Label	<input type="text" value="Molecule-Node1"/>	?
Real Server IP Address	<input type="text" value="192.168.1.110"/>	?
Real Server Port	<input type="text"/>	?
Re-Encrypt to Backend	<input type="checkbox"/>	?
Enable Redirect	<input type="checkbox"/>	?
Weight	<input type="text" value="100"/>	?

**Cancel** **Update**

3. Define the *Label* for the Real Server as required, e.g. **Molecule-Node1**.
4. Set the *Real Server IP Address* field to the required IP address, e.g. **192.168.1.110**.
5. Leave the *Real Server Port* field blank.
6. Leave all other settings at their default value.
7. Click **Update**.
8. Repeat these steps to add the remaining Real Server(s).

## Configure SSL Termination

1. Using the WebUI, navigate to *Cluster Configuration > SSL Termination* and click **Add a new Virtual Service**.
2. Enter the following details:

Label	<input type="text" value="SSL-Molecule"/>	?
Associated Virtual Service	<input type="text" value="Molecule"/>	?
Virtual Service Port	<input type="text" value="443"/>	?
SSL Operation Mode	<input type="text" value="High Security"/>	?
SSL Certificate	<input type="text" value="boomi-cert"/>	?
Source IP Address	<input type="text"/>	?
Enable Proxy Protocol	<input checked="" type="checkbox"/>	?
Bind Proxy Protocol to L7 VIP	<input type="text" value="Molecule"/>	?

**Cancel** **Update**

- Using the *Associated Virtual Service* drop-down, select the Virtual Service created above, e.g. **Molecule**.

 **Note**

Once the VIP is selected, the *Label* field will be auto-populated with **SSL-Molecule**. This can be changed if preferred.

- Ensure that the *Virtual Service Port* is set to **443**.
- Leave *SSL Operation Mode* set to **High Security**.
- Select the *SSL Certificate* uploaded previously.
- Leave all other settings at their default value.
- Click **Update**.

### 10.3.2. VIP 2 - APIManagement

#### Virtual Service (VIP) Configuration

- Using the WebUI, navigate to *Cluster Configuration > Layer 7 – Virtual Services* and click on **Add a new Virtual Service**.
- Enter the following details:

<b>Virtual Service</b>		[Advanced +]
Label	<input type="text" value="APIManagement"/>	?
IP Address	<input type="text" value="192.168.1.241"/>	?
Ports	<input type="text" value="80"/>	?
<b>Protocol</b>		[Advanced +]
Layer 7 Protocol	<input type="text" value="HTTP Mode"/>	?

**Cancel** **Update**

- Define the *Label* for the virtual service as required, e.g. **APIManagement**.
- Set the *Virtual Service IP Address* field to the required IP address, e.g. **192.168.1.241**.
- Set the *Ports* field to **80**.
- Leave the *Layer 7 Protocol* set to **HTTP Mode**.
- Click **Update** to create the Virtual Service.
- Now click **Modify** next to the newly created VIP.
- Scroll to the *Connection Distribution Method* section.
  - Set the *Balance Mode* to **Weighted Round Robin**.
- Scroll to the *Persistence* section.
  - Set the *Persistence Mode* to **Source IP**.

11. Scroll to the *Health Checks* section.
  - Set the *Health Checks* to **Negotiate HTTP (GET)**.
  - Set the *Request to send* to */\_admin/status*.
12. Leave all other settings at their default value.
13. Click **Update**.

### Configure the Associated Real Servers (RIPs)

1. Using the WebUI, navigate to *Cluster Configuration > Layer 7 – Real Servers* and click on **Add a new Real Server** next to the newly created VIP.
2. Enter the following details:

Label	<input type="text" value="APIMgm-Node1"/>	?
Real Server IP Address	<input type="text" value="192.168.1.120"/>	?
Real Server Port	<input type="text"/>	?
Re-Encrypt to Backend	<input type="checkbox"/>	?
Enable Redirect	<input type="checkbox"/>	?
Weight	<input type="text" value="100"/>	?

**Cancel** **Update**

3. Define the *Label* for the Real Server as required, e.g. **APIMgm-Node1**.
4. Set the *Real Server IP Address* field to the required IP address, e.g. **192.168.1.120**.
5. Leave the *Real Server Port* field blank.
6. Leave all other settings at their default value.
7. Click **Update**.
8. Repeat these steps to add the remaining Real Server(s).

### Configure SSL Termination

1. Using the WebUI, navigate to *Cluster Configuration > SSL Termination* and click **Add a new Virtual Service**.
2. Enter the following details:

Label	SSL-APIManagement	?
Associated Virtual Service	APIManagement	?
Virtual Service Port	443	?
SSL Operation Mode	High Security	
SSL Certificate	boomi-cert	?
Source IP Address		?
Enable Proxy Protocol	<input checked="" type="checkbox"/>	?
Bind Proxy Protocol to L7 VIP	APIManagement	?

Cancel
Update

- Using the *Associated Virtual Service* drop-down, select the Virtual Service created above, e.g. **APIManagement**.

 **Note**

Once the VIP is selected, the *Label* field will be auto-populated with **SSL-APIManagement**. This can be changed if preferred.

- Ensure that the *Virtual Service Port* is set to **443**.
- Leave *SSL Operation Mode* set to **High Security**.
- Select the *SSL Certificate* uploaded previously.
- Leave all other settings at their default value.
- Click **Update**.

### 10.3.3. Finalizing the Configuration

To apply the new settings, HAProxy and STunnel must be reloaded. This can be done using the button in the "Commit changes" box at the top of the screen or by using the Restart Services menu option:

- Using the WebUI, navigate to: **Maintenance > Restart Services**.
- Click **Reload HAProxy**.
- Click **Reload STunnel**.

## 11. Testing & Verification

 **Note**

For additional guidance on diagnosing and resolving any issues you may have, please also refer to [Diagnostics & Troubleshooting](#).

### 11.1. Accessing Boomi Blueprint via the Load Balancer

Verify that you're able to successfully access Boomi Blueprint via the Virtual Services on the load balancer.

 **Note**

Make sure that DNS is updated so that any FQDNs used point to the VIPs rather than individual servers.

## 11.2. Using System Overview

The System Overview can be viewed in the WebUI. It shows a graphical view of all Virtual Services & the associated Real Servers (i.e. the Boomi Blueprint servers) and shows the state/health of each server as well as the overall state of each cluster. The example below shows that all servers are healthy (green) and available to accept connections:

### System Overview

2025-01-21 01:45:09 UTC

	VIRTUAL SERVICE	IP	PORTS	CONN	PROTOCOL	METHOD	MODE	
	 Molecule	192.168.1.240	80	0	HTTP	Layer 7	Proxy	
	REAL SERVER	IP	PORTS	WEIGHT	CONN			
	Molecule-Node1	192.168.1.110	80	100	0	Drain	Halt	
	Molecule-Node2	192.168.1.111	80	100	0	Drain	Halt	
	 APIManagement	192.168.1.241	80	0	HTTP	Layer 7	Proxy	
	REAL SERVER	IP	PORTS	WEIGHT	CONN			
	APIMgm-Node1	192.168.1.120	80	100	0	Drain	Halt	
	APIMgm-Node2	192.168.1.121	80	100	0	Drain	Halt	

## 12. Technical Support

For more details about configuring the appliance and assistance with designing your deployment please don't hesitate to contact the support team using the following email address: [support@loadbalancer.org](mailto:support@loadbalancer.org).

## 13. Further Documentation

For additional information, please refer to the [Administration Manual](#).

# 14. Appendix

## 14.1. Configuring HA - Adding a Secondary Appliance

Our recommended configuration is to use a clustered HA pair of load balancers to provide a highly available and resilient load balancing solution. We recommend that the Primary appliance is fully configured first, then the Secondary appliance can be added to create an HA pair. Once the HA pair is configured, load balanced services must be configured and modified on the Primary appliance. The Secondary appliance will be automatically kept in sync.

 **Note**

For Enterprise Azure, the HA pair should be configured first. For more information, please refer to the Azure Quick Start/Configuration Guide available in the [documentation library](#)

The clustered HA pair uses Heartbeat to determine the state of the other appliance. Should the active device (normally the Primary) suffer a failure, the passive device (normally the Secondary) will take over.

### 14.1.1. Non-Replicated Settings

A number of settings are not replicated as part of the Primary/Secondary pairing process and therefore must be manually configured on the Secondary appliance. These are listed by WebUI menu option in the table below:

WebUI Main Menu Option	Sub Menu Option	Description
Local Configuration	Hostname & DNS	Hostname and DNS settings
Local Configuration	Network Interface Configuration	Interface IP addresses, bonding configuration and VLANs
Local Configuration	Routing	Default gateways and static routes
Local Configuration	System Date & time	Time and date related settings
Local Configuration	Physical – Advanced Configuration	Various appliance settings
Local Configuration	Portal Management	Portal management settings
Local Configuration	Security	Security settings
Local Configuration	SNMP Configuration	SNMP settings
Local Configuration	Graphing	Graphing settings
Local Configuration	License Key	Appliance licensing
Maintenance	Backup & Restore	Local XML backups
Maintenance	Software Updates	Appliance software updates
Maintenance	Fallback Page	Fallback page configuration
Maintenance	Firewall Script	Firewall (iptables) configuration
Maintenance	Firewall Lockdown Wizard	Appliance management lockdown settings

### ⚠ Important

Make sure that where any of the above have been configured on the Primary appliance, they're also configured on the Secondary.

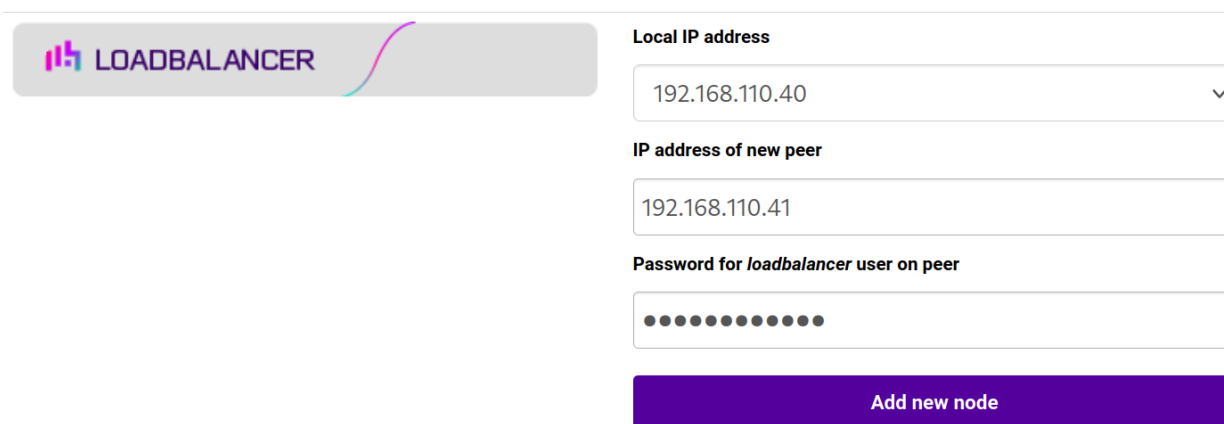

## 14.1.2. Configuring the HA Clustered Pair

### 📌 Note

If you have already run the firewall lockdown wizard on either appliance, you'll need to ensure that it is temporarily disabled on both appliances whilst performing the pairing process.

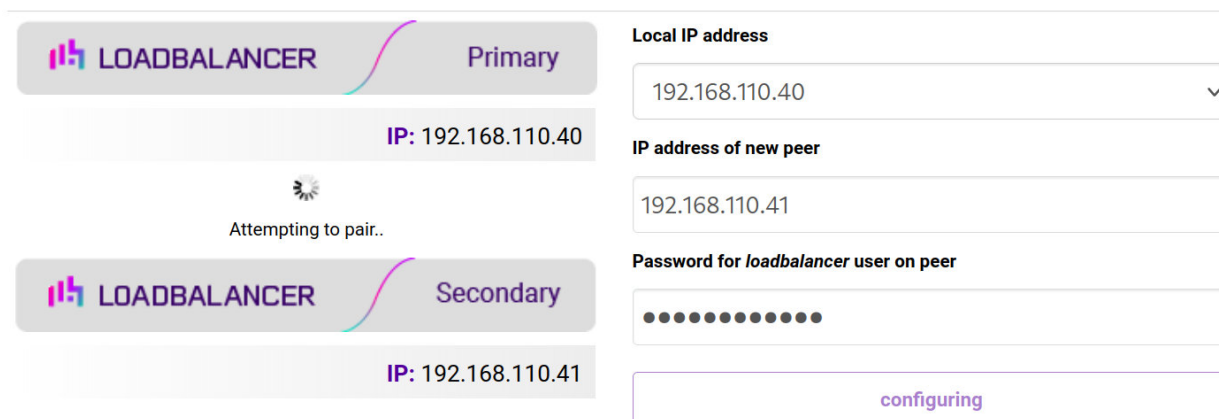

1. Deploy a second appliance that will be the Secondary and configure initial network settings.
2. Using the WebUI on the Primary appliance, navigate to: *Cluster Configuration > High-Availability Configuration*.

### Create a Clustered Pair

3. Specify the IP address and the *loadbalancer* user's password for the Secondary (peer) appliance as shown in the example above.
4. Click **Add new node**.
5. The pairing process now commences as shown below:

### Create a Clustered Pair

6. Once complete, the following will be displayed on the Primary appliance:

## High Availability Configuration - primary

The screenshot displays a configuration interface for a High Availability (HA) setup. It features two Loadbalancer appliances arranged vertically. The top appliance is designated as 'Primary' and has the IP address 192.168.110.40. The bottom appliance is designated as 'Secondary' and has the IP address 192.168.110.41. To the right of these appliances is a prominent red button labeled 'Break Clustered Pair'. Each appliance icon includes the 'LOADBALANCER' logo and a stylized waveform graphic.

7. To finalize the configuration, restart heartbeat and any other services as prompted in the "Commit changes" message box at the top of the screen.

### Note

Clicking the **Restart Heartbeat** button on the Primary appliance will also automatically restart heartbeat on the Secondary appliance.

### Note

For more details on configuring HA with 2 appliances, please refer to [Appliance Clustering for HA](#).

### Note

For details on testing and verifying HA, please refer to [Clustered Pair Diagnostics](#).
