1. About this Guide

This guide details the steps required to configure a load balanced Fujifilm Synapse environment utilizing Loadbalancer.org appliances. It covers Synapse PACS, Synapse VNA, Synapse Mobility and Synapse CWM and details the configuration of the load balancers and also any Synapse server configuration changes that are required to enable load balancing.

For more information about initial appliance deployment, network configuration and using the Web User Interface (WebUI), please also refer to the Administration Manual.

2. Loadbalancer.org Appliances Supported

All our products can be used with Fujifilm Synapse. For full specifications of available models please refer to https://www.loadbalancer.org/products.

Some features may not be available or fully supported in all cloud platforms due to platform specific limitations. For more details, please refer to the "Main Differences to our Standard (Non-Cloud) Product" section in the appropriate cloud platform Quick Start Guide or check with Loadbalancer.org support.

3. Software Versions Supported

3.1. Loadbalancer.org Appliance

- V8.9.1 and later

**Note**

The screenshots used throughout this document aim to track the latest Loadbalancer.org software version. If you’re using an older version, or the very latest, the screenshots presented here may not match your WebUI exactly.

3.2. Fujifilm Synapse

- Fujifilm Synapse PACS – All versions
- Fujifilm Synapse VNA – All versions
- Fujifilm Synapse Mobility – All versions
- Fujifilm Synapse CWM – All versions

4. Load Balancing Fujifilm Synapse

For high availability and scalability, Fujifilm recommend that multiple Synapse Servers are deployed in a load balanced cluster.

4.1. Port Requirements

The following table shows the ports used by the various Synapse systems. The load balancer must be configured to listen on the same ports.
<table>
<thead>
<tr>
<th>Port</th>
<th>Protocols</th>
<th>System</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>TCP</td>
<td>PACS</td>
<td>HTTP</td>
</tr>
<tr>
<td>104</td>
<td>TCP</td>
<td>PACS</td>
<td>DICOM</td>
</tr>
<tr>
<td>80</td>
<td>TCP</td>
<td>VNA</td>
<td>HTTP</td>
</tr>
<tr>
<td>104</td>
<td>TCP</td>
<td>VNA</td>
<td>DICOM</td>
</tr>
<tr>
<td>8080</td>
<td>TCP</td>
<td>Mobility</td>
<td>HTTP</td>
</tr>
<tr>
<td>8443</td>
<td>TCP</td>
<td>Mobility</td>
<td>HTTPS</td>
</tr>
<tr>
<td>80</td>
<td>TCP</td>
<td>CWM</td>
<td>HTTP</td>
</tr>
</tbody>
</table>

### 4.2. Deployment Concept

When Fujifilm systems are deployed with the load balancer, clients connect to the Virtual Service (VIP) on the load balancer rather than connecting directly to one of the Fujifilm servers. The load balancer then distributes these connection to the load balanced servers according to the algorithm selected.

The load balancer can be deployed as a single unit, although Loadbalancer.org recommends a clustered pair for resilience & high availability. Please refer to Configuring HA - Adding a Secondary Appliance for more details on configuring a clustered pair.

### 4.3. Virtual Service (VIP) Requirements

The following tables summarize the VIPs required for each Synapse system and how they are configured.

**Synapse PACS**

2 VIPs are required:

<table>
<thead>
<tr>
<th>Ref.</th>
<th>VIP Name</th>
<th>Operating Mode</th>
<th>Protocol</th>
<th>Port(s)</th>
<th>Persistence</th>
<th>Health check Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIP1</td>
<td>SynapsePacsHTTP</td>
<td>Layer 7 SNAT mode</td>
<td>TCP</td>
<td>80</td>
<td>Source IP</td>
<td>Connect to Port</td>
</tr>
</tbody>
</table>
Synapse VNA
2 VIPs are required:

<table>
<thead>
<tr>
<th>Ref.</th>
<th>VIP Name</th>
<th>Operating Mode</th>
<th>Protocol</th>
<th>Port(s)</th>
<th>Persistence</th>
<th>Health check Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIP1</td>
<td>SynapseVnaHTTP</td>
<td>Layer 7 SNAT mode</td>
<td>TCP</td>
<td>80</td>
<td>Source IP</td>
<td>Connect to Port</td>
</tr>
<tr>
<td>VIP2</td>
<td>SynapseVnaDICOM</td>
<td>Layer 4 DR mode</td>
<td>TCP</td>
<td>104</td>
<td>Source IP</td>
<td>External Script – DICOM-C-ECHO</td>
</tr>
</tbody>
</table>

Synapse Mobility
1 VIP is required:

<table>
<thead>
<tr>
<th>Ref.</th>
<th>VIP Name</th>
<th>Operating Mode</th>
<th>Protocol</th>
<th>Port(s)</th>
<th>Persistence</th>
<th>Health check Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIP1</td>
<td>SynapseMobility</td>
<td>Layer 7 SNAT mode</td>
<td>TCP</td>
<td>8080 8443</td>
<td>Source IP</td>
<td>Negotiate HTTP (GET)</td>
</tr>
</tbody>
</table>

Synapse CWM
1 VIP is required:

<table>
<thead>
<tr>
<th>Ref.</th>
<th>VIP Name</th>
<th>Operating Mode</th>
<th>Protocol</th>
<th>Port(s)</th>
<th>Persistence</th>
<th>Health check Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIP1</td>
<td>SynapseCwm</td>
<td>Layer 7 SNAT mode</td>
<td>HTTP</td>
<td>80</td>
<td>HTTP Cookie</td>
<td>Connect to Port</td>
</tr>
</tbody>
</table>

4.4. Synapse Server Configuration Requirements
As mentioned in the tables above, Layer 7 SNAT mode and Layer 4 DR mode are used when load balancing Fujifilm Synapse.

SNAT Mode
When using Layer 7 SNAT mode, no mode-specific Synapse server configuration changes are required.

DR Mode
When using DR mode, the ‘ARP problem’ must be solved on each Synapse server for DR mode to work. For detailed steps on solving the ARP problem, please refer to DR Mode Server Configuration for more information.

5. Loadbalancer.org Appliance – the Basics

5.1. Virtual Appliance
A fully featured, fully supported 30 day trial is available if you are conducting a PoC (Proof of Concept) deployment. The VA is currently available for VMware, Virtual Box, Hyper-V, KVM, XEN and Nutanix AHV and has been optimized for each Hypervisor. By default, the VA is allocated 2 vCPUs, 4GB of RAM and has a 20GB virtual disk. The Virtual Appliance can be downloaded [here](#).

---

**Note**
The same download is used for the licensed product, the only difference is that a license key file (supplied by our sales team when the product is purchased) must be applied using the appliance’s WebUI.

---

**Note**
Please refer to Virtual Appliance Installation and the ReadMe.txt text file included in the VA download for additional information on deploying the VA using the various Hypervisors.

---

**Note**
The VA has 4 network adapters. For VMware only the first adapter (`eth0`) is connected by default. For HyperV, KVM, XEN and Nutanix AHV all adapters are disconnected by default. Use the network configuration screen within the Hypervisor to connect the required adapters.

---

### 5.2. Initial Network Configuration

After boot up, follow the instructions on the appliance console to configure the management IP address, subnet mask, default gateway, DNS servers and other network and administrative settings.

**Important**
Be sure to set a secure password for the load balancer, when prompted during the setup routine.

---

### 5.3. Accessing the Appliance WebUI

The WebUI is accessed using a web browser. By default, users are authenticated using Apache authentication. Users can also be authenticated against LDAP, LDAPS, Active Directory or Radius - for more information, please refer to External Authentication.

**Note**
There are certain differences when accessing the WebUI for the cloud appliances. For details, please refer to the relevant Quick Start / Configuration Guide.

#### 1. Using a browser, navigate to the following URL:

**Note**
You’ll receive a warning about the WebUI’s SSL certificate. This is due to the default self signed certificate that is used. If preferred, you can upload your own certificate - for more information, please refer to Appliance Security Features.

**Note**
If you need to change the port, IP address or protocol that the WebUI listens on, please refer to Service Socket Addresses.

#### 2. Log in to the WebUI using the following credentials:
Username: loadbalancer
Password: <configured-during-network-setup-wizard>

Note

To change the password, use the WebUI menu option: Maintenance > Passwords.

Once logged in, the WebUI will be displayed as shown below:

3. You’ll be asked if you want to run the Setup Wizard which can be used to configure layer 7 services. Click Dismiss if you’re following a guide or want to configure the appliance manually or click Accept to start the wizard.

Main Menu Options

System Overview - Displays a graphical summary of all VIPs, RIPS and key appliance statistics
Local Configuration - Configure local host settings such as IP address, DNS, system time etc.
Cluster Configuration - Configure load balanced services such as VIPs & RIPS
Maintenance - Perform maintenance tasks such as service restarts and taking backups
View Configuration - Display the saved appliance configuration settings
Reports - View various appliance reports & graphs
Logs - View various appliance logs
Support - Create a support download, contact the support team & access useful links
Live Chat - Start a live chat session with one of our Support Engineers

5.4. Appliance Software Update
To ensure that the appliance(s) are running the latest software version, we recommend a software update check is performed.

Determining the Current Software Version
The software version is displayed at the bottom of the WebUI as shown in the example below:

Checking for Updates using Online Update

1. Using the WebUI, navigate to: Maintenance > Software Update.
2. Select Online Update.
3. If the latest version is already installed, a message similar to the following will be displayed:

   Information: Version v8.11.1 is the current release. No updates are available

4. If an update is available, you'll be presented with a list of new features, improvements, bug fixes and security related updates.
5. Click Online Update to start the update process.

   Note  Do not navigate away whilst the update is ongoing, this may cause the update to fail.

6. Once complete (the update can take several minutes depending on download speed and upgrade version) the following message will be displayed:
7. If services need to be reloaded/restarted or the appliance needs a full restart, you'll be prompted accordingly.

Using Offline Update
If the load balancer does not have access to the Internet, offline update can be used.

Note
Please contact support@loadbalancer.org to check if an update is available and obtain the latest offline update files.

To perform an offline update:

1. Using the WebUI, navigate to: Maintenance > Software Update.
2. Select Offline Update.
3. The following screen will be displayed:

   Software Update

   Offline Update
   The following steps will lead you through offline update.
   1. Contact Loadbalancer.org support to obtain the offline update archive and checksum.
   2. Save the archive and checksum to your local machine.
   3. Select the archive and checksum files in the upload form below.
   4. Click Upload and Install to begin the update process.

   Archive: Choose File No file chosen
   Checksum: Choose File No file chosen
   [Upload and Install]

4. Select the Archive and Checksum files.
5. Click Upload and Install.
6. If services need to be reloaded/restarted or the appliance needs a full restart, you'll be prompted accordingly.

5.5. Ports Used by the Appliance
By default, the appliance uses the following TCP & UDP ports:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>22 *</td>
<td>SSH</td>
</tr>
<tr>
<td>TCP &amp; UDP</td>
<td>53 *</td>
<td>DNS / GSLB</td>
</tr>
<tr>
<td>TCP &amp; UDP</td>
<td>123</td>
<td>NTP</td>
</tr>
<tr>
<td>Protocol</td>
<td>Port</td>
<td>Purpose</td>
</tr>
<tr>
<td>----------</td>
<td>------</td>
<td>---------</td>
</tr>
<tr>
<td>TCP &amp; UDP</td>
<td>161 *</td>
<td>SNMP</td>
</tr>
<tr>
<td>UDP</td>
<td>6694</td>
<td>Heartbeat between Primary &amp; Secondary appliances in HA mode</td>
</tr>
<tr>
<td>TCP</td>
<td>7778</td>
<td>HAProxy persistence table replication</td>
</tr>
<tr>
<td>TCP</td>
<td>9000 *</td>
<td>Gateway service (Centralized/Portal Management)</td>
</tr>
<tr>
<td>TCP</td>
<td>9080 *</td>
<td>WebUI - HTTP (disabled by default)</td>
</tr>
<tr>
<td>TCP</td>
<td>9081 *</td>
<td>Nginx fallback page</td>
</tr>
<tr>
<td>TCP</td>
<td>9443 *</td>
<td>WebUI - HTTPS</td>
</tr>
<tr>
<td>TCP</td>
<td>25565 *</td>
<td>Shuttle service (Centralized/Portal Management)</td>
</tr>
</tbody>
</table>

Note: The ports used for SSH, GSLB, SNMP, the WebUI, the fallback page, the gateway service and the shuttle service can be changed if required. For more information, please refer to Service Socket Addresses.

5.6. HA Clustered Pair Configuration
Loadbalancer.org recommend that load balancer appliances are deployed in pairs for high availability. In this guide a single unit is deployed first, adding a secondary unit is covered in Configuring HA - Adding a Secondary Appliance.

6. Load Balancing Fujifilm Synapse PACS
6.1. Appliance Configuration
Configuring VIP1 - synapsePacsHTTP
a) Setting up the Virtual Service
1. Using the WebUI, navigate to: Cluster Configuration > Layer 7 – Virtual Service and click Add a New Virtual Service.
2. Enter the following details:
3. Enter an appropriate label for the VIP, e.g. **SynapsPacsHTTP**.

4. Set the **Virtual Service IP address** field to the required IP address, e.g. **10.50.20.10**.

5. Set the **Virtual Service Ports** field to **80**.

6. Set **Layer 7 Protocol** to **TCP Mode**.

7. Click **Update**.

**b) Setting up the Real Servers**

1. Using the WebUI, navigate to: **Cluster Configuration > Layer 7 – Real Servers** and click **Add a new Real Server** next to the newly created VIP.

2. Enter the following details:

   ![Layer 7 Add a new Real Server](image)

3. Enter an appropriate label for the RIP, e.g. **Server1**.

4. Set the **Real Server IP Address** field to the required IP address, e.g. **10.50.20.20**.

5. Set the **Real Server Port** field to **80**.

6. Click **Update**.

7. Repeat the above steps to add your other server(s).

**Configuring VIP2 - synapsePacsDICOM**

**a) Configure the DICOM health check**

1. Using the WebUI, navigate to **Cluster Configuration > Health Check Scripts** and click **Add New Health Check**.
2. Specify an appropriate Name for the health check, e.g. **DICOM-Check**.

3. Set Type to **Virtual Service**.

4. Set Template to **DICOM-C-ECHO**.

5. Click Update.

b) Setting up the Virtual Service (VIP)

1. Using the WebUI, navigate to: **Cluster Configuration > Layer 4 – Virtual Services** and click Add a new Virtual Service.

2. Enter the following details:

   - **Label**: Enter an appropriate label (name) for the VIP, e.g. **SynapsePacsDICOM**.
   - **IP Address**: Set the Virtual Service IP address field to the required IP address, e.g. **10.50.20.11**.
   - **Ports**: Set the Virtual Service Ports field to **104**. For layer 4 DR mode a star ( * ) can be specified instead of **104** to mean "all ports" if required.
   - **Protocol**: Leave Protocol set to **TCP**.
   - **Forwarding Method**: Leave the Forwarding Method set to **Direct Return**.

3. Enter an appropriate label (name) for the VIP, e.g. **SynapsePacsDICOM**.

4. Set the Virtual Service IP address field to the required IP address, e.g. **10.50.20.11**.

5. Set the Virtual Service Ports field to **104**.
8. Click **Update**.

9. Now click **Modify** next to the newly created Virtual Service.

10. Scroll down to the *Health Checks* section.
    
    a. Set **Check Type** to **External script**.
    
    b. Set **External Script** to **DICOM-Check**.

11. Click **Update**.

c) **Setting up the Real Server (RIP)**

1. Using the WebUI, navigate to: *Cluster Configuration > Layer 4 – Real Servers* and click **Add a new Real Server** next to the newly created VIP.

2. Enter the following details:

   
   ![Real Server Configuration](image)

   3. Enter an appropriate label (name) for the RIP, e.g. *Server1*.
   
   4. Change the **Real Server IP Address** field to the required IP address, e.g. *10.50.20.21*.
   
   5. Click **Update**.
   
   6. Repeat the above steps to add your other server(s).

6.2. **Synapse PACS Configuration**

Since VIP2 is configured using layer 4 DR (Direct Return) mode, the “ARP Problem” must be solved on each Synapse server as mentioned in **DR Mode**. For full details on how this is done, please refer to **DR Mode Server Configuration**.

7. **Load Balancing Fujifilm Synapse VNA**

7.1. **Appliance Configuration**

Configuring VIP1 - *synapseVnaHTTP*

a) **Setting up the Virtual Service**

1. Using the WebUI, navigate to: *Cluster Configuration > Layer 7 – Virtual Service* and click **Add a New Virtual Service**.
2. Enter the following details:

Layer 7 - Add a new Virtual Service

<table>
<thead>
<tr>
<th>Virtual Service</th>
<th>[Advanced +]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>SynapseVnaHTTP</td>
</tr>
<tr>
<td>IP Address</td>
<td>10.50.20.12</td>
</tr>
<tr>
<td>Ports</td>
<td>80</td>
</tr>
</tbody>
</table>

Layer 7 Protocol: TCP Mode

3. Enter an appropriate label for the VIP, e.g. SynapseVnaHTTP.

4. Set the Virtual Service IP address field to the required IP address, e.g. 10.50.20.12.

5. Set the Virtual Service Ports field to 80.

7. Click Update.

b) Setting up the Real Servers

1. Using the WebUI, navigate to: Cluster Configuration > Layer 7 – Real Servers and click Add a new Real Server next to the newly created VIP.

2. Enter the following details:

Layer 7 Add a new Real Server

<table>
<thead>
<tr>
<th>Label</th>
<th>Server1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Real Server IP Address</td>
<td>10.50.20.22</td>
</tr>
<tr>
<td>Real Server Port</td>
<td>80</td>
</tr>
</tbody>
</table>

3. Enter an appropriate label for the RIP, e.g. Server1.

4. Set the Real Server IP Address field to the required IP address, e.g. 10.50.20.22.

5. Set the Real Server Port field to 80.

6. Click Update.
7. Repeat the above steps to add your other server(s).

**Configuring VIP2 - synapseVnaDICOM**

**a) Configure the DICOM health check**

| Note | Skip this step if you have already configured a DICOM health check for PACS. |

1. Using the WebUI, navigate to *Cluster Configuration > Health Check Scripts* and click *Add New Health Check*.

<table>
<thead>
<tr>
<th>Health Check Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name: DICOM-Check</td>
</tr>
<tr>
<td>Type: Virtual Service</td>
</tr>
<tr>
<td>Template: DICOM-C-ECHO</td>
</tr>
</tbody>
</table>

2. Specify an appropriate *Name* for the health check, e.g. *DICOM-Check*.
3. Set *Type* to *Virtual Service*.
4. Set *Template* to *DICOM-C-ECHO*.
5. Click *Update*.

**b) Setting up the Virtual Service (VIP)**

1. Using the WebUI, navigate to: *Cluster Configuration > Layer 4 – Virtual Services* and click *Add a new Virtual Service*.
2. Enter the following details:

<table>
<thead>
<tr>
<th>Label</th>
<th>SynapseVnaDICOM</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>10.50.20.13</td>
</tr>
<tr>
<td>Ports</td>
<td>104</td>
</tr>
<tr>
<td>Protocol</td>
<td>TCP</td>
</tr>
<tr>
<td>Forwarding</td>
<td>Direct Routing</td>
</tr>
</tbody>
</table>

3. Enter an appropriate label (name) for the VIP, e.g. *SynapseVnaDICOM*.
4. Set the *Virtual Service IP* address field to the required IP address, e.g. *10.50.20.13*.
5. Set the *Virtual Service Ports* field to 104.

![Note]

For layer 4 DR mode a star (*) can be specified instead of 104 to mean "all ports" if required.

6. Leave *Protocol* set to *TCP*.

7. Leave the *Forwarding Method* to *Direct Return*.

8. Click *Update*.

9. Now click *Modify* next to the newly created Virtual Service.

10. Scroll down to the *Health Checks* section.

    a. Set *Check Type* to *External script*.

    b. Set *External Script* to *DICOM-Check*.

11. Click *Update*.

c) Setting up the Real Server (RIP)

1. Using the WebUI, navigate to: *Cluster Configuration > Layer 4 – Real Servers* and click *Add a new Real Server* next to the newly created VIP.

2. Enter the following details:

![Real Server Configuration]

3. Enter an appropriate label (name) for the RIP, e.g. *Server1*.

4. Change the *Real Server IP Address* field to the required IP address, e.g. *10.50.20.23*.

5. Click *Update*.

6. Repeat the above steps to add your other server(s).

7.2. Synapse VNA Configuration

Since VIP2 is configured using layer 4 DR (Direct Return) mode, the "ARP Problem" must be solved on each Synapse server as mentioned in DR Mode. For full details on how this is done, please refer to DR Mode Server Configuration.
8. Load Balancing Fujifilm Synapse Mobility

8.1. Appliance Configuration

Configuring VIP1 - synapseMobility

a) Setting up the Virtual Service

1. Using the WebUI, navigate to: **Cluster Configuration > Layer 7 – Virtual Service** and click **Add a New Virtual Service**.

2. Enter the following details:

   - **Label**: SynapseMobility
   - **IP Address**: 10.50.20.14
   - **Ports**: 8080,8443
   - **Layer 7 Protocol**: TCP Mode

3. Enter an appropriate label for the VIP, e.g. SynapseMobility.

4. Set the **Virtual Service IP address** field to the required IP address, e.g. 10.50.20.14.

5. Set the **Virtual Service Ports** field to 8080,8443.

6. Set **Layer 7 Protocol** set to TCP Mode.

7. Click **Update**.

8. Scroll down to the **Health Checks** section and set the **Health Check** to Negotiate HTTP (GET).

10. Leave **Response Expected** blank (this will configure the load balancer to look for a 200 OK response).

b) Setting up the Real Servers

1. Using the WebUI, navigate to: **Cluster Configuration > Layer 7 – Real Servers** and click **Add a new Real Server** next to the newly created VIP.

2. Enter the following details:
3. Enter an appropriate label for the RIP, e.g. Server1.

4. Set the Real Server IP Address field to the required IP address, e.g. 10.50.20.24.

5. Leave the Real Server Port field blank.

6. Click Update.

7. Repeat the above steps to add your other server(s).

8.2. Synapse Mobility Configuration

As mentioned in SNAT Mode, when using Layer 7 SNAT mode no mode-specific Synapse server configuration changes are required.

9. Load Balancing Fujifilm Synapse CWM

9.1. Appliance Configuration

Configuring VIP1 - SynapseCwm

a) Setting up the Virtual Service

1. Using the WebUI, navigate to: Cluster Configuration > Layer 7 – Virtual Service and click Add a New Virtual Service.

2. Enter the following details:
3. Enter an appropriate label for the VIP, e.g. SynapseCwm.
4. Set the Virtual Service IP address field to the required IP address, e.g. 10.50.20.15.
5. Set the Virtual Service Ports field to 80.
7. Click Update.

b) Setting up the Real Servers
1. Using the WebUI, navigate to: Cluster Configuration > Layer 7 – Real Servers and click Add a new Real Server next to the newly created VIP.
2. Enter the following details:

   Layer 7 Add a new Real Server

<table>
<thead>
<tr>
<th>Label</th>
<th>Server1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Real Server IP Address</td>
<td>10.50.20.25</td>
</tr>
<tr>
<td>Real Server Port</td>
<td>80</td>
</tr>
<tr>
<td>Re-Encrypt to Backend</td>
<td>Off</td>
</tr>
<tr>
<td>Weight</td>
<td>100</td>
</tr>
</tbody>
</table>

3. Enter an appropriate label for the RIP, e.g. Server1.
4. Set the Real Server IP Address field to the required IP address, e.g. 10.50.20.25.
5. Set the Real Server Port field to 80.
6. Click Update.
7. Repeat the above steps to add your other server(s).
9.2. Synapse CWM Configuration
As mentioned in SNAT Mode, when using Layer 7 SNAT mode no mode-specific Synapse server configuration changes are required.

10. Finalizing the Configuration
Once all the VIPs have been configured, HAProxy must be reloaded to apply the new settings (for Layer 7 VIPs). This can be done using the button in the “Commit changes” box at the top of the screen or by using the Restart Services menu option:

1. Using the WebUI, navigate to: Maintenance > Restart Services.
2. Click Reload HAProxy.

11. Additional Configuration Options & Settings

11.1. SSL Termination
SSL termination can be handled in the following ways:

1. On the Real Servers - aka SSL Pass-through
2. On the load balancer – aka SSL Offloading
3. On the load balancer with re-encryption to the backend servers – aka SSL Bridging

Note
SSL termination on the load balancer can be very CPU intensive.

By default, a self-signed certificate is used for the new SSL VIP. Certificates can be requested on the load balancer or uploaded as described in the section below. The default self-signed certificate can be regenerated if needed using the WebUI menu option: SSL Certificate and clicking the Regenerate Default Self Signed Certificate button.

The backend for the SSL VIP can be either a Layer 7 SNAT mode VIP or a Layer 4 NAT or SNAT mode VIP. Layer 4 DR mode cannot be used since stunnel acts as a proxy, and the VPSA node servers see requests with a source IP address of the VIP. However, since the VPSA node servers believe that they own the VIP (due to the loopback adapter configured to handle to ARP problem) they are unable to reply to stunnel.

11.2. SSL Termination on the load balancer - SSL Offloading
In this case, an SSL VIP utilizing stunnel is configured on the appliance and an SSL certificate is uploaded and associated to the Virtual Service. Data is encrypted from the client to the load balancer, but is un-encrypted from the load balancer to the backend servers as shown above.

**Certificates**

If you already have an SSL certificate in either PFX or PEM file format, this can be uploaded to the Load balancer using the certificate upload option as explained below in *Uploading Certificates*. Alternatively, you can create a Certificate Signing Request (CSR) on the load balancer and send this to your CA to create a new certificate. For more information please refer to *Generating a CSR on the Load Balancer*.

**Uploading Certificates**

If you already have a certificate in either PEM or PFX format, this can be uploaded to the load balancer.

To upload a Certificate:

1. Using the WebUI, navigate to: *Cluster Configuration > SSL Certificates*.
2. Click *Add a new SSL Certificate* & select *Upload prepared PEM/PFX file*.
3. Enter a suitable Label (name) for the certificate, e.g. Cert1.

4. Browse to and select the certificate file to upload (PEM or PFX format).

5. Enter the password if applicable.

6. Click **Upload Certificate**, if successful, a message similar to the following will be displayed:

   ![Information: cert1 SSL Certificate uploaded successfully.]

**Note** To backup your certificates use the WebUI menu option: **Maintenance > Backup & Restore > Download SSL Certificates.**

### 11.3. Configuring SSL Termination on the Load Balancer

To configure SSL termination for Synapse Mobility:

1. Configure a layer 7 HTTP mode VIP to handle HTTP traffic
2. Configure SSL termination to handle HTTPS traffic

**1) Configuring SSL Offloading for Synapse Mobility using a Layer 7 HTTP mode VIP**

**a) Setting up the Virtual Service (VIP)**

1. Using the WebUI, navigate to **Cluster Configuration > Layer 7 – Virtual Services** and click **Add a new Virtual Service**.

2. Enter the following details:

   ![Layer 7 - Add a new Virtual Service](image)

   - **Label**: SynapseMobility
   - **IP Address**: 10.50.20.14
   - **Ports**: 8080
   - **Protocol**: HTTP Mode

3. Enter an appropriate label for the VIP, e.g. **SynapseMobility**.

4. Set the **Virtual Service IP address** field to the required IP address, e.g. **10.50.20.14**.

5. Set the **Virtual Service Ports** field to **8080**.
7. Click Update.
8. Click Modify.
9. Scroll down to the Health Checks section and set the Health Check to Negotiate HTTP (GET).
11. Leave Response Expected blank (this will configure the load balancer to look for a 200 OK response).

b) Setting up the Real Servers
1. Using the WebUI, navigate to: Cluster Configuration > Layer 7 – Real Servers and click Add a new Real Server next to the newly created VIP.
2. Enter the following details:

   ![Layer 7 Add a new Real Server](image)

   3. Enter an appropriate label for the RIP, e.g. Server1.
   4. Set the Real Server IP Address field to the required IP address, e.g. 10.50.20.24.
   5. Leave the Real Server Port field blank.
   6. Click Update.
   7. Repeat the above steps to add your other server(s).

2) Configure SSL termination
1. Using the WebUI, navigate to Cluster Configuration > SSL Termination and click Add a new Virtual Service.
2. Set **Associated Virtual Service** to the appropriate VIP, e.g. SynapseMobility. This will automatically fill in the label as the VIP name with SSL inserted in front of the VIP name e.g. SSL-SynapseMobility.

<table>
<thead>
<tr>
<th>Label</th>
<th>SSL-SynapseMobility</th>
</tr>
</thead>
<tbody>
<tr>
<td>Associated Virtual Service</td>
<td>SynapseMobility</td>
</tr>
<tr>
<td>Virtual Service Port</td>
<td>8443</td>
</tr>
<tr>
<td>SSL Operation Mode</td>
<td>High Security</td>
</tr>
<tr>
<td>SSL Certificate</td>
<td>Default Self Signed Certificate</td>
</tr>
<tr>
<td>Source IP Address</td>
<td></td>
</tr>
<tr>
<td>Enable Proxy Protocol</td>
<td></td>
</tr>
<tr>
<td>Bind Proxy Protocol to L7 VIP</td>
<td>SynapseMobility</td>
</tr>
</tbody>
</table>

**Note**
The Associated Virtual Service drop-down is populated with all single port, standard (i.e. non-manual) Layer 7 VIPs available on the load balancer. Using a Layer 7 VIP for the backend is the recommended method although as mentioned earlier, Layer 4 NAT mode and layer 4 SNAT mode VIPs can also be used if required. To forward traffic from the SSL VIP to these type of VIPs, you’ll need to set Associated Virtual Service to **Custom**, then configure the IP address & port of the required VIP.

3. Set **Virtual Service Port** to 8443.
5. Select the required certificate from the **SSL Certificate** drop-down.
6. Click **Update**.

Once configured, HTTP traffic will be load balanced by the Layer 7 SNAT mode VIP and HTTPS traffic will be terminated by the SSL VIP, then passed on to the Layer 7 SNAT mode VIP as unencrypted HTTP for load balancing.

### Finalizing the Configuration
To apply the new settings, HAProxy and STunnel must both be reloaded. This can be done using the buttons in the “Commit changes” box at the top of the screen or by using the **Restart Services** menu option:

1. Using the WebUI, navigate to: **Maintenance > Restart Services**.
2. Click **Reload HAProxy**.
3. Click **Reload STunnel**.
12. Testing & Verification

For additional guidance on diagnosing and resolving any issues you may have, please also refer to Diagnostics & Troubleshooting.

12.1. Using the System Overview

The System Overview shows a graphical view of all VIPs & RIPs (i.e. the Synapse servers) and shows the state/health of each server as well as the state of the each cluster as a whole. The example below shows that all Synapse servers are healthy and available to accept connections:

12.2. Client Connection Tests

Ensure that clients can connect via the load balancer to the Synapse servers. You'll probably need to create new DNS records or modify your existing DNS records, replacing the IP addresses of individual servers or the cluster with the IP address of the Virtual Service on the load balancer.

13. Technical Support

For more details about configuring the appliance and assistance with designing your deployment please don’t hesitate to contact the support team using the following email address: support@loadbalancer.org.

14. Additional Documentation

For additional information, please refer to the Administration Manual.
15. Appendix

15.1. Configuring HA - Adding a Secondary Appliance

Our recommended configuration is to use a clustered HA pair of load balancers to provide a highly available and resilent load balancing solution. We recommend that the Primary appliance is fully configured first, then the Secondary appliance can be added to create an HA pair. Once the HA pair is configured, load balanced services must be configured and modified on the Primary appliance. The Secondary appliance will be automatically kept in sync.

For Enterprise Azure, the HA pair should be configured first. For more information, please refer to the Azure Quick Start/Configuration Guide available in the documentation library.

The clustered HA pair uses Heartbeat to determine the state of the other appliance. Should the active device (normally the Primary) suffer a failure, the passive device (normally the Secondary) will take over.

Non-Replicated Settings

A number of settings are not replicated as part of the Primary/Secondary pairing process and therefore must be manually configured on the Secondary appliance. These are listed by WebUI menu option in the table below:

<table>
<thead>
<tr>
<th>WebUI Main Menu Option</th>
<th>Sub Menu Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Configuration</td>
<td>Hostname &amp; DNS</td>
<td>Hostname and DNS settings</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>Network Interface Configuration</td>
<td>Interface IP addresses, bonding configuration and VLANs</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>Routing</td>
<td>Default gateways and static routes</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>System Date &amp; time</td>
<td>Time and date related settings</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>Physical – Advanced Configuration</td>
<td>Various appliance settings</td>
</tr>
<tr>
<td>Local Configuration</td>
<td>Portal Management</td>

<tr>
<td>Local Configuration</td>
<td>License Key</td>
<td>Appliance licensing</td>
</tr>
<tr>
<td>Maintenance</td>
<td>Backup &amp; Restore</td>
<td>Local XML backups</td>
</tr>
<tr>
<td>Maintenance</td>
<td>Software Updates</td>
<td>Appliance software updates</td>
</tr>
<tr>
<td>Maintenance</td>
<td>Fallback Page</td>
<td>Fallback page configuration</td>
</tr>
<tr>
<td>Maintenance</td>
<td>Firewall Script</td>
<td>Firewall (iptables) configuration</td>
</tr>
<tr>
<td>Maintenance</td>
<td>Firewall Lockdown Wizard</td>
<td>Appliance management lockdown settings</td>
</tr>
</tbody>
</table>
Important: Make sure that where any of the above have been configured on the Primary appliance, they're also configured on the Secondary.

Configuring the HA Clustered Pair

Note: If you have already run the firewall lockdown wizard on either appliance, you'll need to ensure that it is temporarily disabled on both appliances whilst performing the pairing process.

1. Deploy a second appliance that will be the Secondary and configure initial network settings.

2. Using the WebUI on the Primary appliance, navigate to: Cluster Configuration > High-Availability Configuration.

3. Specify the IP address and the loadbalancer user's password for the Secondary (peer) appliance as shown in the example above.

4. Click Add new node.

5. The pairing process now commences as shown below:

6. Once complete, the following will be displayed on the Primary appliance:
7. To finalize the configuration, restart heartbeat and any other services as prompted in the "Commit changes" message box at the top of the screen.

---

Clicking the **Restart Heartbeat** button on the Primary appliance will also automatically restart heartbeat on the Secondary appliance.

---

For more details on configuring HA with 2 appliances, please refer to **Appliance Clustering for HA**.

---

For details on testing and verifying HA, please refer to **Clustered Pair Diagnostics**.

---

### 15.2. DR Mode Server Configuration

When using Layer 4 DR mode the ARP problem must be solved. This involves configuring each Synapse Server to accept traffic destined for the VIP in addition to it’s own IP address, and ensuring that each server does not respond to ARP requests for the VIP address – only the load balancer should do this. The following section covers Windows 2012 and later, for earlier versions of Windows please refer to the **Administration Manual**.

#### Windows Server 2012 & Later

Windows Server 2012 and later support Direct Routing (DR) mode through the use of the Microsoft Loopback Adapter that must be installed and configured on each load balanced (Real) Server. The IP address configured on the Loopback Adapter must be the same as the Virtual Service (VIP) address. This enables the server to receive packets that have their destination set as the VIP address. If a Real Server is included in multiple DR mode VIPs, an IP address for each VIP must be added to the Loopback Adapter.

In addition, the strong/weak host behavior must be configured on each Real Server. The weak host model allows packets with any IP to be sent or received via an interface. The strong host model only allows packets with an IP belonging to the interface to be sent or received.

---

**Important** The following 3 steps must be completed on **all** Real Servers associated with the VIP.

---

**Step 1 of 3: Install the Microsoft Loopback Adapter**

1. Click **Start**, then run **hdwwiz** to start the Hardware Installation Wizard.
2. Once the Wizard has started, click **Next**.

3. Select **Install the hardware that I manually select from a list (Advanced)**, click **Next**.

4. Select **Network adapters**, click **Next**.

5. Select **Microsoft & Microsoft KM-Test Loopback Adapter**, click **Next**.

6. Click **Next** to start the installation, when complete click **Finish**.

**Step 2 of 3: Configure the Loopback Adapter**

1. Open Control Panel and click **Network and Sharing Center**.

2. Click **Change adapter settings**.

3. Right-click the new Loopback Adapter and select **Properties**.

**Note**

You can configure IPv4 or IPv6 addresses or both depending on your requirements.

**IPv4 Addresses**

1. Uncheck all items except **Internet Protocol Version 4 (TCP/IPv4)** as shown below:
2. Ensure that Internet Protocol Version (TCP/IPv4) is selected, click Properties and configure the IP address to be the same as the Virtual Service address (VIP) with a subnet mask of 255.255.255.255, e.g., **192.168.2.20/255.255.255.255** as shown below:

**Note**  
192.168.2.20 is an example, make sure you specify the correct VIP address.

**Note**  
If a Real Server is included in multiple DR mode VIPs, an IP address for each VIP must be
3. Click **OK** then click **Close** to save and apply the new settings.

IPv6 Addresses

1. Uncheck all items except **Internet Protocol Version 6 (TCP/IPv6)** as shown below:

   ![IPv6 Properties](image)

   ![IPv6 Properties](image)

2. Ensure that **Internet Protocol Version (TCP/IPv6)** is selected, click **Properties** and configure the IP address to be the same as the Virtual Service (VIP) and set the **Subnet Prefix Length** to be the same as your network setting, e.g. `2001:470:1f09:e72::15/64` as shown below:
3. Click **OK** then click **Close** to save and apply the new settings.

**Step 3 of 3: Configure the strong/weak host behavior**

The strong/weak host behavior can be configured using either of the following 2 methods:

- Option 1 - Using network shell (netsh) commands
- Option 2 - Using PowerShell cmdlets

The commands in this section assume that the LAN Adapter is named "net" and the Loopback Adapter is named "loopback" as shown in the example below:

Either adjust the commands to use the names allocated to your LAN and loopback adapters, or rename the adapters before running the commands. Names are case sensitive so make sure...
that the interface names used in the commands match the adapter names exactly.

Option 1 - Using Network Shell (netsh) Commands

To configure the correct strong/weak host behavior run the following commands:

For IPv4 addresses:

```
netsh interface ipv4 set interface "net" weakhostreceive=enabled
netsh interface ipv4 set interface "loopback" weakhostreceive=enabled
netsh interface ipv4 set interface "loopback" weakhostsend=enabled
```

For IPv6 addresses:

```
netsh interface ipv6 set interface "net" weakhostreceive=enabled
netsh interface ipv6 set interface "loopback" weakhostreceive=enabled
netsh interface ipv6 set interface "loopback" weakhostsend=enabled
netsh interface ipv6 set interface "loopback" dadtransmits=0
```

Option 2 - Using PowerShell Cmdlets

For IPv4 addresses:

```
Set-NetIpInterface -InterfaceAlias loopback -WeakHostReceive enabled -WeakHostSend enabled -DadTransmits 0 -AddressFamily IPv4
Set-NetIpInterface -InterfaceAlias net -WeakHostReceive enabled -AddressFamily IPv4
```

For IPv6 Addresses:

```
Set-NetIpInterface -InterfaceAlias loopback -WeakHostReceive enabled -WeakHostSend enabled -DadTransmits 0 -AddressFamily IPv6
Set-NetIpInterface -InterfaceAlias net -WeakHostReceive enabled -AddressFamily IPv6
```

About Loadbalancer.org

Loadbalancer.org’s mission is to ensure that its clients’ businesses are never interrupted. The load balancer experts ask the right questions to get to the heart of what matters, bringing a depth of understanding to each deployment. Experience enables Loadbalancer.org engineers to design less complex, unbreakable solutions - and to provide exceptional personalized support.
