1. About this Guide
This guide details the steps required to configure a highly available IBM Watson Health iConnect Enterprise Archive environment utilizing Loadbalancer.org appliances. It covers the configuration of the load balancers and also any iConnect Enterprise Archive configuration changes that are required.

For more information about initial appliance deployment, network configuration and using the Web User Interface (WebUI), please also refer to the Administration Manual.

2. Loadbalancer.org Appliances Supported
All our products can be used for load balancing IBM Watson Health iConnect Enterprise Archive. The complete list of models is shown below:

<table>
<thead>
<tr>
<th>Discontinued Models</th>
<th>Current Models *</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise R16</td>
<td>Enterprise R20</td>
</tr>
<tr>
<td>Enterprise VA R16</td>
<td>Enterprise MAX</td>
</tr>
<tr>
<td>Enterprise VA</td>
<td>Enterprise 10G</td>
</tr>
<tr>
<td>Enterprise R320</td>
<td>Enterprise 40G</td>
</tr>
<tr>
<td></td>
<td>Enterprise Ultra</td>
</tr>
<tr>
<td></td>
<td>Enterprise VA R20</td>
</tr>
<tr>
<td></td>
<td>Enterprise VA MAX</td>
</tr>
<tr>
<td></td>
<td>Enterprise AWS **</td>
</tr>
<tr>
<td></td>
<td>Enterprise AZURE **</td>
</tr>
</tbody>
</table>

* For full specifications of these models please refer to: http://www.loadbalancer.org/products/hardware
** Some features may not be supported, please check with Loadbalancer.org support

3. Loadbalancer.org Software Versions Supported
- V8.3.6 & later

4. IBM Watson Health iConnect Enterprise Archive Software Versions Supported
- IBM Watson Health iConnect Enterprise Archive – all versions

5. Load Balancing iConnect Enterprise Archive
For high availability, IBM Watson Health recommend that a load balancer is used to enable rapid failover to the secondary iConnect Enterprise Cluster should the Primary Cluster become unavailable.
Port Requirements

The following table shows the ports used by iConnect Enterprise Archive. The load balancer must be configured to listen on the same ports.

<table>
<thead>
<tr>
<th>Port</th>
<th>Protocols</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>12000</td>

</tbody>
</table>

Deployment Concept

When iConnect Enterprise Archive is deployed with the load balancer, clients connect to the Virtual Service (VIP) on the load balancer rather than connecting directly to one of the iConnect Enterprise Archive Clusters. Under normal conditions, these connections are then forwarded to the Primary Cluster.

Note: The load balancer can be deployed as a single unit, although Loadbalancer.org recommends a clustered pair for resilience & high availability. Please refer to section 1 in the appendix on page 14 for more details on configuring a clustered pair.

Should the Primary Cluster become unavailable, failover to the Secondary Cluster can be handled in either of the following ways:

- **Automatically** – In this case, health checks are configured at 30 second intervals. Should there be 10 consecutive health check failures, failover to the Secondary Cluster occurs.
• **Manually** – In this case, failover to the Secondary Cluster must be triggered manually using the ‘Halt’ feature in the load balancer’s WebUI. Please refer to page 12 for more details.

Note: The way the Virtual Service's health check is configured determines which of these failover methods is used.

**Virtual Service (VIP) Requirements**

A single multi-port VIP is used that listens on all required ports. The VIP is configured as follows:

- Deployment mode: Layer 4 NAT (Network Address Translation) mode
- Listens on a total of 7 ports as described on the table and diagram on page 4
- The health-check configuration depends on whether automatic or manual failover is required:
  - for **automatic** failover an external script is used, the script checks that all 7 ports are available and runs every 30 seconds, if connection to one or more of the ports fails, the health check is deemed to have failed, if there are 10 consecutive health check failures, cluster failover occurs
  - for **manual** failover the health check is set to: **No checks, always On**
- The associated Real Server is configured to be the cluster IP address of the Primary Cluster
- The fallback server is configured to be the cluster IP address of the Secondary Cluster

**Deployment Mode**

As mentioned above, the VIP is configured using Layer 4 NAT mode. With this mode, return traffic must pass via the load balancer. To achieve this, the default gateway of each cluster must be set to be the load balancer. For a clustered pair (our recommended configuration), an additional floating IP address must be used for this purpose. This allows the same IP address to be brought up on the slave appliance should an appliance failover occur.

**6. Loadbalancer.org Appliance – the Basics**

**Virtual Appliance Download & Deployment**

A fully featured, fully supported 30 day trial is available if you are conducting a PoC (Proof of Concept) deployment. The VA is currently available for VMware, Virtual Box, Hyper-V, KVM and XEN and has been optimized for each Hypervisor. By default, the VA is allocated 1 CPU, 2GB of RAM and has an 8GB virtual disk. The Virtual Appliance can be downloaded [here](#).

Note: The same download is used for the licensed product, the only difference is that a license key file (supplied by our sales team when the product is purchased) must be applied using the appliance’s WebUI.
Initial Network Configuration
The IP address, subnet mask, default gateway and DNS settings can be configured in several ways as detailed below:

Method 1 - Using the Network Setup Wizard at the console
After boot up, follow the instructions on the console to configure the IP address, subnet mask, default gateway and DNS settings.

Method 2 - Using the WebUI
Using a browser, connect to the WebUI on the default IP address/port: https://192.168.2.21:9443
To set the IP address & subnet mask, use: Local Configuration > Network Interface Configuration
To set the default gateway, use: Local Configuration > Routing
To configure DNS settings, use: Local Configuration > Hostname & DNS

Accessing the Web User Interface (WebUI)

1. Browse to the following URL: https://192.168.2.21:9443/lbadmin/
   (replace with your IP address if it's been changed)
   * Note the port number → 9443

2. Login to the WebUI:
   
   Username: loadbalancer
   Password: loadbalancer

   Note: To change the password, use the WebUI menu option: Maintenance > Passwords.
HA Clustered Pair Configuration
Loadbalancer.org recommend that load balancer appliances are deployed in pairs for high availability. In this guide a single unit is deployed first, adding a secondary slave unit is covered in section 1 of the appendix on page 14.
7. Appliance & iConnect Enterprise Archive Configuration

Appliance Configuration

Network Configuration
When using Layer 4 NAT mode, two Interfaces are required, this can be achieved by using two network adapters, or by creating VLANs on a single adapter. The following configuration uses 2 separate network adapters, one for each subnet.

To Configure network settings using eth0 & eth1:

1. Using the WebUI, navigate to: Local Configuration > Network Interface Configuration

![IP Address Assignment](image)

2. Enter an IP address/mask in the subnet where the iConnect Enterprise Archive Servers are located, e.g. 192.168.100.1/24
3. Enter an IP address/mask in the subnet where the VIP & clients are located, e.g. 192.168.200.1/24
4. Click Configure Interfaces

Note: There are no restrictions on which interface is used for each requirement.

Floating IP Configuration (For The Clusters Default Gateway)
As mentioned on page 5, when using Layer 4 NAT mode and a clustered pair of load balancers, a floating IP address must be configured on the load balancer for use as the iConnect Enterprise Archive server's default gateway.

1. Using the WebUI, navigate to: Cluster Configuration > Floating IP's
2. Enter the IP address you’d like to use as the default gateway. e.g. **192.168.100.254**

3. Click **Add Floating IP**

### Configuring VIP1 – All VNA Services

#### a) Setting up the Virtual Service (VIP)

1. Using the WebUI, navigate to: **Cluster Configuration > Layer 4 – Virtual Services** and click **Add a new Virtual Service**
2. Enter the following details:

<table>
<thead>
<tr>
<th>Label</th>
<th>VNA</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>192.168.200.100</td>
</tr>
<tr>
<td>Ports</td>
<td>12000, 12100, 12200, 12300, 12301, 12950, 12800</td>
</tr>
<tr>
<td>Protocol</td>
<td>TCP</td>
</tr>
<tr>
<td>Forwarding Method</td>
<td>NAT</td>
</tr>
</tbody>
</table>

3. Enter an appropriate label (name) for the VIP, e.g. **VNA**
4. Set the Virtual Service IP address field to the required IP address, e.g. **192.168.200.100**
5. Set the Virtual Service Ports field to **12000,12100,12200,12300,12301,12950,12800**
6. Leave **Protocol** set to **TCP**
7. Set the **Forwarding Method** to **NAT**
8. Click **Update**
9. Now click **Modify** next to the newly created VIP
10. Configure health check settings:
    - For **automatic** failover:
      - Create the following file: `/var/lib/loadbalancer.org/check/IBM-WHI-iConnect-Enterprise-Archive`
- Set file permissions to **755**
- Edit the file and copy / paste the following script:

```bash
#!/bin/bash

# IBM Watson Health Imaging - iConnect Enterprise Archive
#
#
# (c) Loadbalancer.org 2019
#
#
# 2019-07-31 - Initial write - Aaron West
<support@loadbalancer.org> #
#
#

### Variables

# Space separated port list to check using a TCP half open check (SYN Scan)
HALF_OPEN_RPT="12800"

# Space separated port list to check using a full 3 way handshake (Connect to port)
FULL_3WAY_RPT="12000 12100 12200 12300 12301 12950"

# $3 represents the real server address as passed by the load balancer
RIP="${3}"

# Timeout for checking each port
TIMEOUT="3"

### Shouldn't need to edit below here

PATH=/usr/local/sbin:/usr/local/bin:/sbin:/bin:/usr/sbin:/usr/bin

for i in ${HALF_OPEN_RPT}; do
  timeout ${TIMEOUT} nmap -sS -p ${i} ${RIP} 2>&1 |
grep -q 'open'
  ec=$?
  if [ $ec -ne "0" ]; then
    exit $ec
  fi
```
```
done
for i in ${FULL_3WAY_RPT}; do
    nc -w ${TIMEOUT} -zvn ${RIP} $i &>/dev/null
    ec=$?
    if [ $ec -ne "0" ]; then
        exit $ec
    fi
done
```

- Save the file
- In the Health Checks section set the Check Type to External Script
- Set the External Script drop-down to IBM-WHI-iConnect-Enterprise-Archive (the script just created)
- Click Update

For manual failover:

- Set the Check Type to No checks, Always On
- Click Update

11. Set the Fallback Server IP Address field to the IP address of the Secondary iConnect Enterprise Archive Cluster
12. Set the Fallback Server Port field to 0 (numerical zero), this ensures that the fallback server (i.e. the Secondary Cluster) can receive connections on all required ports
13. Enable (check) the MASQ Fallback checkbox
14. Click Update

b) Setting up the Real Server (RIP)

1. Using the WebUI, navigate to: Cluster Configuration > Layer 4 – Real Servers and click Add a new Real Server next to the newly created VNA VIP
2. Enter the following details:
3. Enter an appropriate label (name) for the RIP, e.g. **PrimaryCluster**
4. Set the **Real Server IP Address** field to the IP address of the Primary iConnect Enterprise Archive Cluster
5. Leave the **Real Server Port** field blank
6. Click **Update**

**iConnect Enterprise Archive Server Configuration**

As mentioned on page 5, when using Layer 4 NAT mode and a clustered pair of load balancers, a floating IP address must be configured for use as the default gateway. Set the default gateway of each iConnect Enterprise Archive to be this IP address.

8. **Testing & Verification**

Under normal circumstances the Primary Cluster handles all connections. Failover to the Secondary Cluster is handled automatically or manually depending on how the VIP is configured (see page 5).

**Automatic Failover**

Automatic failover occurs after 5 minutes. To trigger a failover, the Primary Cluster must be continuously unavailable for this time.

**Manual Failover**

To trigger a failover to the Secondary Cluster, the ‘Halt’ option in the System Overview is used:

![System Overview](image)

Once Halted, the VIP & RIP will be shown colored blue, connections will then be forwarded to the fallback server, i.e. the Secondary Cluster:

![System Overview](image)

To return to the Primary Cluster, the ‘Online’ option is used:

![System Overview](image)
**Client Connection Tests**

Ensure that clients can connect via the load balancer to the iConnect Enterprise Archive Cluster / MergePACS cluster. You'll probably need to create new DNS records or modify your existing DNS records, replacing the IP addresses of individual servers or the cluster with the IP address of the Virtual Service on the load balancer.

Note: For more details on testing & diagnosing load balanced services please refer to chapter 12 in the Administration Manual.

9. **Technical Support**

For more details about configuring the appliance and assistance with designing your deployment please don't hesitate to contact the support team using the following email address: support@loadbalancer.org.

10. **Additional Documentation**

11. **Conclusion**

Loadbalancer.org appliances provide a very cost effective solution for highly available load balanced IBM Watson Health iConnect Enterprise Archive environments.
12. Appendix

1 - Clustered Pair Configuration – Adding a Slave Unit

If you initially configured just the master unit and now need to add a slave - our recommended procedure, please refer to the relevant section below for more details:

Note: A number of settings are not replicated as part of the master/slave pairing process and therefore must be manually configured on the slave appliance. These are listed below:

- Hostname & DNS settings
- Network settings including IP addresses, bonding configuration and VLANs
- Routing configuration including default gateways and static routes
- Date & time settings
- Physical – Advanced Configuration settings including Internet Proxy IP address & port, Firewall table size, SMTP relay and Syslog server
- SNMP settings
- Graphing settings
- Firewall Script & Firewall Lockdown Script settings
- Software updates

To add a slave node – i.e. create a highly available clustered pair:

- Deploy a second appliance that will be the slave and configure initial network settings
- Using the WebUI, navigate to: Cluster Configuration > High-Availability Configuration

- Specify the IP address and the loadbalancer users password (the default is 'loadbalancer') for the slave (peer) appliance as shown above
• Click **Add new node**

• The pairing process now commences as shown below:

![CREATE a CLUSTERED PAIR](image)

• Once complete, the following will be displayed:

![HIGH AVAILABILITY CONFIGURATION - master](image)

• To finalize the configuration, restart heartbeat and any other services as prompted in the blue message box at the top of the screen

Note: Clicking the Restart Heartbeat button on the master appliance will also automatically restart heartbeat on the slave appliance.

Note: Please refer to chapter 9 – Appliance Clustering for HA in the Administration Manual for more detailed information on configuring HA with 2 appliances.

About Loadbalancer.org

Loadbalancer.org's mission is to ensure that its clients' businesses are never interrupted. The load balancer experts ask the right questions to get to the heart of what matters, bringing a depth of understanding to each deployment. Experience enables Loadbalancer.org engineers to design less complex, unbreakable solutions - and to provide exceptional personalized support.
