1. About this Guide

This guide details the steps required to configure a highly available IBM Watson Health iConnect Enterprise Archive & MergePACS environment utilizing Loadbalancer.org appliances. It covers the configuration of the load balancers and also any iConnect Enterprise Archive & MergePACS configuration changes that are required.

For more information about initial appliance deployment, network configuration and using the Web User Interface (WebUI), please also refer to the Administration Manual.

2. Loadbalancer.org Appliances Supported

All our products can be used for load balancing IBM Watson Health iConnect Enterprise Archive & MergePACS. The complete list of models is shown below:

<table>
<thead>
<tr>
<th>Discontinued Models</th>
<th>Current Models *</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise R16</td>
<td>Enterprise R20</td>
</tr>
<tr>
<td>Enterprise VA R16</td>
<td>Enterprise MAX</td>

</tr>
</tbody>
</table>

* For full specifications of these models please refer to: http://www.loadbalancer.org/products/hardware

** Some features may not be supported, please check with Loadbalancer.org support

3. Loadbalancer.org Software Versions Supported

- v8.3.6 and later

4. IBM Watson Health iConnect Enterprise Archive & MergePACS Software Versions Supported

- IBM Watson Health iConnect Enterprise Archive – all versions
- IBM Watson Health MergePACS – all versions
5. Load Balancing iConnect Enterprise Archive & MergePACS

For high availability, IBM Watson Health recommend that a load balancer is used to enable rapid failover to the secondary iConnect Enterprise Cluster / MergePACS Cluster should the Primary Cluster become unavailable.

Port Requirements

The following table shows the ports used by iConnect Enterprise Archive. The load balancer must be configured to listen on the same ports.

<table>
<thead>
<tr>

Deployment Concept

iConnect Enterprise Archive

When iConnect Enterprise Archive is deployed with the load balancer, clients connect to the Virtual Service (VIP) on the load balancer rather than connecting directly to one of the iConnect Enterprise Archive Clusters. Under normal conditions, these connections are then forwarded to the Primary Cluster.
MergePACS

When MergePACS is deployed with the load balancer, clients connect to the Virtual Service (VIP) on the load balancer rather than connecting directly to one of the MergePACS Clusters. Under normal conditions, these connections are then forwarded to the Primary Cluster.

Note: VIP1 (VNA) and VIP2 (PACS) are configured on a single clustered pair of load balancers.

Note: The load balancer can be deployed as a single unit, although Loadbalancer.org recommends a clustered pair for resilience & high availability. Please refer to section 1 in the appendix on page 22 for more details on configuring a clustered pair.

Should the Primary Cluster become unavailable, failover to the Secondary Cluster can be handled in either of the following ways:

- **Automatically** – In this case, health checks are configured at 30 second intervals. Should there be 10 consecutive health check failures, failover to the Secondary Cluster occurs.

- **Manually** – In this case, failover to the Secondary Cluster must be triggered manually using the 'Halt' feature in the load balancer’s WebUI. Please refer to page 20 for more details.

Note: The way the Virtual Service’s health check is configured determines which of these failover methods is used.
Virtual Service (VIP) Requirements

To provide load balancing and HA for iConnect Enterprise Archive & MergePACS, 2 VIPs are required as depicted in the diagrams above, 1 multiport VIP for iConnect Enterprise Archive and 1 multiport VIP for MergePACS:

**iConnect Enterprise Archive**

A single multi-port VIP is used that listens on all required ports. The VIP is configured as follows:

- Deployment mode: Layer 4 NAT (Network Address Translation) mode
- Listens on a total of 7 ports as described on the table and diagram on page 4
- The health-check configuration depends on whether automatic or manual failover is required:
  - for **automatic** failover an external script is used, the script checks that all 7 ports are available and runs every 30 seconds, if connection to one or more of the ports fails, the health check is deemed to have failed, if there are 10 consecutive health check failures, cluster failover occurs
  - for **manual** failover the health check is set to: No checks, always On
- The associated Real Server is configured to be the cluster IP address of the Primary Cluster
- The fallback server is configured to be the cluster IP address of the Secondary Cluster

**MergePACS**

A single multi-port VIP is used that listens on all required ports. The VIP is configured as follows:

- Deployment mode: Layer 4 DR (Direct Return) mode
- Listens on a total of 7 ports as described on the table and diagram on page 4
- The health-check configuration depends on whether automatic or manual failover is required:
  - for **automatic** failover an external script is used, the script checks that all 7 ports are available and runs every 30 seconds, if connection to one or more of the ports fails, the health check is deemed to have failed, if there are 10 consecutive health check failures, cluster failover occurs
  - for **manual** failover the health check is set to: No checks, always On
- The associated Real Server is configured to be the cluster IP address of the Primary Cluster
- The fallback server is configured to be the cluster IP address of the Secondary Cluster

**Deployment Mode**

**iConnect Enterprise Archive**

As mentioned above, the VIP for iConnect Enterprise Archive is configured using Layer 4 NAT mode. With this mode, return traffic must pass via the load balancer. To achieve this, the default gateway of each cluster must be set to be the load balancer. For a clustered pair (our recommended configuration), an additional floating IP address must be used for this purpose. This allows the same IP address to be brought up on the slave appliance should an appliance failover occur.
MergePACS

As mentioned above, the VIP for MergePACS is configured using Layer 4 DR (Direct Return) mode. This mode offers the best possible performance since replies go directly from the MergePACS Cluster to the client, and not via the load balancer. To use this mode, the “ARP Problem” must be solved on each MergePACS server as explained on page 16.

6. Loadbalancer.org Appliance – the Basics

Virtual Appliance Download & Deployment

A fully featured, fully supported 30 day trial is available if you are conducting a PoC (Proof of Concept) deployment. The VA is currently available for VMware, Virtual Box, Hyper-V, KVM and XEN and has been optimized for each Hypervisor. By default, the VA is allocated 1 CPU, 2GB of RAM and has an 8GB virtual disk. The Virtual Appliance can be downloaded here.

Note: The same download is used for the licensed product, the only difference is that a license key file (supplied by our sales team when the product is purchased) must be applied using the appliance’s WebUI.

Note: Please refer to the Administration Manual and the ReadMe.txt text file included in the VA download for more detailed information on deploying the VA using various Hypervisors.

Initial Network Configuration

The IP address, subnet mask, default gateway and DNS settings can be configured in several ways as detailed below:

Method 1 - Using the Network Setup Wizard at the console

After boot up, follow the instructions on the console to configure the IP address, subnet mask, default gateway and DNS settings.

Method 2 - Using the WebUI

Using a browser, connect to the WebUI on the default IP address/port: https://192.168.2.21:9443
To set the IP address & subnet mask, use: Local Configuration > Network Interface Configuration
To set the default gateway, use: Local Configuration > Routing
To configure DNS settings, use: Local Configuration > Hostname & DNS

Accessing the Web User Interface (WebUI)

1. Browse to the following URL: https://192.168.2.21:9443/lbadmin/
(replace with your IP address if it's been changed)
* Note the port number → 9443

2. Login to the WebUI:

   **Username:** loadbalancer
   **Password:** loadbalancer

   Note: To change the password, use the WebUI menu option: **Maintenance > Passwords**.

Once logged in, the WebUI will be displayed as shown below:
HA Clustered Pair Configuration

Loadbalancer.org recommend that load balancer appliances are deployed in pairs for high availability. In this guide a single unit is deployed first, adding a secondary slave unit is covered in section 1 of the appendix on page 22.
7. Appliance, iConnect Enterprise Archive & MergePACS Configuration

Appliance Configuration

Network Configuration
When using Layer 4 NAT mode (for load balancing iConnect Enterprise Archive), two Interfaces are required, this can be achieved by using two network adapters, or by creating VLAN's on a single adapter. The following configuration uses 2 separate network adapters, one for each subnet.

To Configure network settings using eth0 & eth1:
1. Using the WebUI, navigate to: Local Configuration > Network Interface Configuration

![IP Address Assignment](image)

2. Enter an IP address/mask in the subnet where the iConnect Enterprise Archive's are located, e.g. 192.168.100.1/24
3. Enter an IP address/mask in the subnet where the VIP & clients are located, e.g. 192.168.200.1/24
4. Click Configure Interfaces

Note: There are no restrictions on which interface is used for each requirement.

Floating IP Configuration (For The iConnect Enterprise Archive's Default Gateway)
As mentioned on page 6, when using Layer 4 NAT mode and a clustered pair of load balancers, a floating IP address must be configured on the load balancer for use as the iConnect Enterprise Archive Server's default gateway.

1. Using the WebUI, navigate to: Cluster Configuration > Floating IP's
2. Enter the IP address you’d like to use as the default gateway, e.g. 192.168.100.254
3. Click Add Floating IP

Configuring VIP1 – All VNA Services

a) Setting up the Virtual Service (VIP)
   1. Using the WebUI, navigate to: Cluster Configuration > Layer 4 – Virtual Services and click Add a new Virtual Service
   2. Enter the following details:

   ![Virtual Service Configuration](image)

   3. Enter an appropriate label (name) for the VIP, e.g. VNA
   4. Set the Virtual Service IP address field to the required IP address, e.g. 192.168.200.100
   5. Set the Virtual Service Ports field to 12000,12100,12200,12300,12301,12950,12800
   6. Leave Protocol set to TCP
   7. Set the Forwarding Method to NAT
   8. Click Update
   9. Now click Modify next to the newly created VIP
   10. Configure health check settings:
       For automatic failover:
           - Create the following file: /var/lib/loadbalancer.org/check/IBM-WHI-iConnect-Enterprise-Archive
- Set file permissions to **755**
- Edit the file and copy / paste the following script:

```
#!/bin/bash

# IBM Watson Health Imaging - iConnect Enterprise Archive

# (c) Loadbalancer.org 2019

# 2019-07-31 - Initial write - Aaron West
<support@loadbalancer.org> #

### Shouldn't need to edit below here

PATH=/usr/local/sbin:/usr/local/bin:/sbin:/bin:/usr/sbin:/usr/bin

for i in ${HALF_OPEN_RPT}; do
  timeout ${TIMEOUT} nmap -sS -p ${i} ${RIP} 2>&1 |
  grep -q 'open'
  ec=$?
  if [ $ec -ne "0" ]; then
    exit $ec
  fi
```

© Copyright Loadbalancer.org • www.loadbalancer.org • sales@loadbalancer.org
for i in ${FULL_3WAY_RPT}; do
    nc -w ${TIMEOUT} -zvn ${RIP} $i &>/dev/null
    ec=$?
    if [ $ec -ne "0" ]; then
        exit $ec
    fi
done

- Save the file
- In the Health Checks section set the Check Type to External Script
- Set the External Script drop-down to IBM-WHI-iConnect-Enterprise-Archive (the script just created)
- Click Update

For manual failover:
- Set the Check Type to No checks, Always On
- Click Update

11. Set the Fallback Server IP Address field to the IP address of the Secondary iConnect Enterprise Archive Cluster
12. Set the Fallback Server Port field to 0 (numerical zero), this ensures that the fallback server (i.e. the Secondary Cluster) can receive connections on all required ports
13. Enable (check) the MASQ Fallback checkbox
14. Click Update

b) Setting up the Real Server (RIP)
1. Using the WebUI, navigate to: Cluster Configuration > Layer 4 – Real Servers and click Add a new Real Server next to the newly created VNA VIP
2. Enter the following details:
3. Enter an appropriate label (name) for the RIP, e.g. **PrimaryCluster**
4. Set the **Real Server IP Address** field to the IP address of the Primary iConnect Enterprise Archive Cluster
5. Leave the **Real Server Port** field blank
6. Click **Update**

**Configuring VIP2 – All PACS Services**

**a) Setting up the Virtual Service (VIP)**

1. Using the WebUI, navigate to **Cluster Configuration > Layer 4 – Virtual Services** and click **Add a new Virtual Service**
2. Enter the following details:

   ![Virtual Service Configuration](image)

   - **Label**: PACS
   - **IP Address**: 192.168.100.100
   - **Ports**: 104,80,8080,443,8443,5222,1001
   - **Protocol**: TCP
   - **Forwarding Method**: Direct Routing

3. Enter an appropriate label (name) for the VIP, e.g. **PACS**
4. Set the **Virtual Service IP address** field to the required IP address, e.g. **192.168.100.100**
5. Set the **Virtual Service Ports** field to **104,80,8080,443,8443,5222,1001**
6. Leave **Protocol** set to **TCP**
7. Leave **Forwarding Method** set to **Direct Routing**
8. Click **Update**
9. Now click **Modify** next to the newly created VIP
10. Configure health check settings:
   - For **automatic** failover:
     - Create the following file: `/var/lib/loadbalancer.org/check/IBM-WHI-MergePACS`
     - Set file permissions to **755**
     - Edit the file and copy / paste the following script:
#!/bin/bash

######################################################
# IBM Watson Health Imaging - Merge PACS healthcheck
# (c) Loadbalancer.org 2019
#
# 2019-07-31 - Initial write - Aaron West
<support@loadbalancer.org>
#
######################################################
### Variables

# Space separated port list to check using a TCP half open check (SYN Scan)
HALF_OPEN_RPT="1000"

# Space separated port list to check using a full 3 way handshake (Connect to port)
FULL_3WAY_RPT="104 80 8080 443 8443 5222"

# $3 represents the real server address as passed by the load balancer
RIP="$3"

# Timeout for checking each port
TIMEOUT="3"

### Shouldn't need to edit below here

PATH=/usr/local/sbin:/usr/local/bin:/sbin:/bin:/usr/sbin:/usr/bin

for i in ${HALF_OPEN_RPT}; do
timeout $TIMEOUT nmap -sS -p $i $RIP 2>&1 | grep -q 'open'
ec=$?
if [ $ec -ne "0" ]; then
  exit $ec
fi
done

for i in ${FULL_3WAY_RPT}; do
  nc -w $TIMEOUT -zvn $RIP $i &>/dev/null
  ec=$?
  if [ $ec -ne "0" ]; then
    exit $ec
  fi
done

▪ Save the file
In the Health Checks section set the Check Type to **External Script**

- Set the External Script drop-down to **IBM-WHI-MergePACS** (the script just created)
- Click **Update**

For manual failover:

- Set the Check Type to **No checks, Always On**
- Click **Update**

11. Set the Fallback Server IP Address field to the IP address of the Secondary MergePACS Cluster

12. Set the Fallback Server Port field to 0 (numerical zero) - this ensures that the fallback server (i.e. the Secondary Cluster) can receive connections on all required ports

13. Enable (check) the **MASQ Fallback** checkbox

14. Click **Update**

### b) Setting up the Real Servers (RIPs)

1. Using the WebUI, navigate to **Cluster Configuration > Layer 4 – Real Servers** and click **Add a new Real Server** next to the newly created PACS VIP

2. Enter the following details:

   ![Real Server Configuration](image)

   - Enter an appropriate label (name) for the RIP, e.g. **PrimaryCluster**
   - Set the **Real Server IP Address** field to the IP address of the Primary MergePACS Cluster
   - Click **Update**

### iConnect Enterprise Archive Server Configuration

As mentioned on page 6, when using Layer 4 NAT mode and a clustered pair of load balancers, a floating IP address must be configured for use as the default gateway. Set the default gateway of each iConnect Enterprise Archive to be this IP address.
MergePACS Server Configuration

As mentioned on page 6, when using Layer 4 DR mode, the ARP problem must be solved. This involves configuring each MergePACS Server to be able to receive traffic destined for the VIP, and ensuring that each Server does not respond to ARP requests for the VIP address – only the load balancer should do this.

Note: The steps below are for Windows 2012 / 2016 IPv4 addresses, for other versions of Windows & IPv6 configuration steps, please refer to chapter 6 in the Administration Manual.

Step 1 of 3 : Install the Microsoft Loopback Adapter

1. Click Start, then run hdwwiz to start the Hardware Installation Wizard
2. When the Wizard has started, click Next
3. Select Install the hardware that I manually select from a list (Advanced), click Next
4. Select Network adapters, click Next
5. Select Microsoft & Microsoft KM-Test Loopback Adapter, click Next

   ![Microsoft Loopback Adapter Installation](image)

6. Click Next to start the installation, when complete click Finish

Step 2 of 3 : Configure the Loopback Adapter

1. Open Control Panel and click Network and Sharing Center
2. Click Change adapter settings
3. Right-click the new Loopback Adapter and select Properties
4. Un-check all items except Internet Protocol Version 4 (TCP/IPv4) as shown below:
5. For IPv4 addresses, select **Internet Protocol Version (TCP/IPv4)**, click **Properties** and configure the IP address to be the same as the address you’ve used for the Virtual Service (VIP) with a subnet mask of 255.255.255.255, e.g. 192.168.100.100/255.255.255.255 as shown below:
6. Click **OK** on TCP/IP Properties, then click **Close** on the Interface Properties to save and apply the new settings.

**Step 3 of 3 : Configure the strong/weak host behavior**

Windows Server 2000 and Windows Server 2003 use the weak host model for sending and receiving for all IPv4 interfaces and the strong host model for sending and receiving for all IPv6 interfaces. You cannot configure this behavior. The Next Generation TCP/IP stack in Windows 2008 and later supports strong host sends and receives for both IPv4 and IPv6 by default. To ensure that Windows 2012/2016 is running in the correct mode to be able to respond to the VIP, the following commands must be run on each Real Server:

For IPv4 addresses:

- netsh interface ipv4 set interface "net" weakhostreceive=enabled
- netsh interface ipv4 set interface "loopback" weakhostreceive=enabled
- netsh interface ipv4 set interface "loopback" weakhostsend=enabled

For IPv6 addresses:

- netsh interface ipv6 set interface "net" weakhostreceive=enabled
- netsh interface ipv6 set interface "loopback" weakhostreceive=enabled
- netsh interface ipv6 set interface "loopback" weakhostsend=enabled

For these commands to work, the LAN connection NIC must be named “net” and the loopback NIC must be named “loopback” as shown below. If you prefer to leave your current NIC names, then the commands above must be modified accordingly. For example, if your network adapters are named “LAN” and “LOOPBACK”, the commands required would be:

- netsh interface ipv4 set interface "LAN" weakhostreceive=enabled
- netsh interface ipv4 set interface "LOOPBACK" weakhostreceive=enabled
- netsh interface ipv4 set interface "LOOPBACK" weakhostsend=enabled

**Note:** The names for the NICs are case sensitive, so make sure that the name used for the interface and the name used in the commands match exactly.

- Start Powershell or use a command window to run the appropriate netsh commands as shown in the example below:
Repeat steps 1 – 3 on all remaining MergePACS Server(s).

8. Testing & Verification

Under normal circumstances the Primary Cluster handles all connections. Failover to the Secondary Cluster is handled automatically or manually depending on how the VIP is configured (see page 6).

Automatic Failover

Automatic failover occurs after 5 minutes. To trigger a failover, the Primary Cluster must be continuously unavailable for this time.

Manual Failover

To trigger a failover to the Secondary Cluster, the ‘Halt’ option in the System Overview is used:

(Screen shots for the VNA VIP are shown, the same concept applies to the PACS VIP)

Once Halted, the VIP & RIP will be shown colored blue, connections will then be forwarded to the fallback server, i.e. the Secondary Cluster:

To return to the Primary Cluster, the ‘Online’ option is used:
Client Connection Tests

Ensure that clients can connect via the load balancer to the iConnect Enterprise Archive Cluster / MergePACS cluster. You'll probably need to create new DNS records or modify your existing DNS records, replacing the IP addresses of individual servers or the cluster with the IP address of the Virtual Service on the load balancer.

Note: For more details on testing & diagnosing load balanced services please refer to chapter 12 in the Administration Manual.

9. Technical Support

For more details about configuring the appliance and assistance with designing your deployment please don't hesitate to contact the support team using the following email address: support@loadbalancer.org.

10. Additional Documentation

11. Conclusion

Loadbalancer.org appliances provide a very cost effective solution for highly available load balanced IBM Watson Health iConnect Enterprise Archive & MergePACS environments.
12. Appendix

1 - Clustered Pair Configuration – Adding a Slave Unit
If you initially configured just the master unit and now need to add a slave - our recommended procedure, please refer to the relevant section below for more details:

Note: A number of settings are not replicated as part of the master/slave pairing process and therefore must be manually configured on the slave appliance. These are listed below:

- Hostname & DNS settings
- Network settings including IP addresses, bonding configuration and VLANs
- Routing configuration including default gateways and static routes
- Date & time settings
- Physical – Advanced Configuration settings including Internet Proxy IP address & port, Firewall table size, SMTP relay and Syslog server
- SNMP settings
- Graphing settings
- Firewall Script & Firewall Lockdown Script settings
- Software updates

To add a slave node – i.e. create a highly available clustered pair:

- Deploy a second appliance that will be the slave and configure initial network settings
- Using the WebUI, navigate to: Cluster Configuration > High-Availability Configuration

- Specify the IP address and the loadbalancer users password (the default is 'loadbalancer') for the slave (peer) appliance as shown above
• Click Add new node

• The pairing process now commences as shown below:

![Create a Clustered Pair Diagram]

- Once complete, the following will be displayed:

![High Availability Configuration - Master Diagram]

- To finalize the configuration, restart heartbeat and any other services as prompted in the blue message box at the top of the screen

Note: Clicking the Restart Heartbeat button on the master appliance will also automatically restart heartbeat on the slave appliance.

Note: Please refer to chapter 9 – Appliance Clustering for HA in the Administration Manual for more detailed information on configuring HA with 2 appliances.

About Loadbalancer.org

Loadbalancer.org's mission is to ensure that its clients' businesses are never interrupted. The load balancer experts ask the right questions to get to the heart of what matters, bringing a depth of understanding to each deployment. Experience enables Loadbalancer.org engineers to design less complex, unbreakable solutions - and to provide exceptional personalized support.
