1. About this Guide

This document provides a quick reference guide on how to load balance Microsoft Remote Desktop Session Host servers using the Enterprise Azure Loadbalancer.org Azure cloud appliance.

- Microsoft Connection Broker is used, the Loadbalancer.org appliance interacts with the Routing Token to reconnect user sessions to the correct Session Host.
- The Loadbalancer.org Feedback Agent is installed on the Session Host servers to provide real time performance stats to enable optimum load distribution.

2. Software Versions Supported

2.1. Loadbalancer.org Appliance

- V8.9.1 and later

Note: The screenshots used throughout this document aim to track the latest Loadbalancer.org software version. If you’re using an older version, or the very latest, the screenshots presented here may not match your WebUI exactly.

2.2. Microsoft Windows Server

- All versions

3. Related Documentation

For additional information, please refer to the Administration Manual, the Azure Quick Start Configuration Guide and the Microsoft Remote Desktop Services Deployment Guide.

4. Load Balanced Ports / Services

<table>
<thead>
<tr>
<th>Port</th>

<th>Transport Layer Protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>3389</td>
<td>Remote Desktop Protocol (RDP)</td>
<td>TCP</td>
</tr>
</tbody>
</table>

5. Azure Network Security Group inbound rules

The following inbound rules must be configured in your Network Security Group:

- For Management: TCP 9443 (Appliance WebUI)
- For access to the load balanced RDP Services: TCP 3389 (RDP)

6. Appliance Configuration Overview

6.1. Operation Mode
The load balancer is configured using layer 7 SNAT mode. This mode does not require any mode specific configuration changes to the load balanced Real Servers.

6.2. Session Host Health-check
A connect to port health-check is used to verify that each Session Host server is available.

6.3. Deployment Concept
The diagram below shows how the system is configured.

Notes

1. The Loadbalancer.org Feedback Agent provides real time server utilization statistics based on either CPU or RAM utilization or a combination of both.

2. Connection Broker can be deployed in HA mode if required using 2 Connection Broker servers and an SQL database.

7. Deploying & Accessing the Appliance

7.1. Deployment
Deploy the Loadbalancer.org appliance as described in the Azure Quick Start Configuration Guide.

7.2. Accessing the Appliance WebUI
Using a browser, navigate to the public IP address or FQDN on port 9443:

https://<Public IP address>:9443
To configure an FQDN in Azure please refer to this link.

You'll receive a warning about the WebUI's SSL certificate. This is due to the default self signed certificate that is used. If preferred, you can upload your own certificate - for more information, please refer to Appliance Security Features.

If you need to change the port, IP address or protocol that the WebUI listens on, please refer to Service Socket Addresses.

Log in to the WebUI using the following default credentials:

**Username:** loadbalancer

**Password:** loadbalancer

To change the password, use the WebUI option: Maintenance > Passwords.

Once logged in, the WebUI is displayed:
WebUI Menu Options

**System Overview** - Displays a graphical summary of all VIPs, RIPv and key appliance statistics

**Local Configuration** - Configure local host settings such as IP address, DNS, system time etc.

**Cluster Configuration** - Configure load balanced services such as VIPs & RIPv

**Maintenance** - Perform maintenance tasks such as service restarts and taking backups

**View Configuration** - Display the saved appliance configuration settings

**Reports** - View various appliance reports & graphs

**Logs** - View various appliance logs

**Support** - Create a support download, contact the support team & access useful links

**Live Chat** - Start a Live Chat session with one of our Support Engineers

8. Configuration Steps

8.1. Appliance Configuration
Configure the Virtual Service

1. Using the WebUI, navigate to: Cluster Configuration > Layer 7 – Virtual Services and click Add a New Virtual Service.

2. Enter the following details:

   Layer 7 – Add a new Virtual Service

   ![Virtual Service Configuration](image)

   3. Define the required Label (name) for the VIP, e.g. RDS-SessionHost.

   4. Set the Virtual Service IP Address field to an appropriate value, e.g. 10.0.0.100.

   5. Set the Virtual Service Ports field to 3389.

   7. Click Update.

   8. Now click Modify next to the newly created VIP.

   9. Scroll to the Persistence section.

      - Change Persistence Mode to MS Session Broker.

   10. Scroll to the Feedback Method section.

      - Change Feedback Method to Agent.

   11. Scroll to the Other section and click [Advanced].

      - Enable (check) the Timeout checkbox and set both Client Timeout and Real Server Timeout to a suitable value, e.g. 1h (1 hour).

   12. Click Update.

Define the Real (Session Host) Servers

1. Using the WebUI, navigate to: Cluster Configuration > Layer 7 – Real Servers and click Add a new Real Server next to the newly created VIP.

2. Enter the following details:
3. Enter an appropriate label for the Real Server, e.g. **SH1**.

4. Set the **Real Server IP Address** field to the required address, e.g. **10.0.0.120**.

5. Set the **Real Server Port** field to **3389**.

6. Click **Update**.

7. Repeat the above steps to add your other Session Host server(s).

### Apply the New Settings

To apply the new settings, HAProxy must be reloaded. This can be done using the button in the "Commit changes" box at the top of the screen or by using the **Restart Services** menu option:

1. Using the WebUI, navigate to: **Maintenance > Restart Services**.

2. Click **Reload HAProxy**.

### 8.2. Session Host Server Configuration

**Configure Server Settings**

To configure the Session Host Servers, please refer to the section "Load balancing Session Hosts when deployed with Connection Broker" in the Microsoft Remote Desktop Services Deployment Guide.

**Install The Feedback Agent**

The Loadbalancer.org Windows Feedback Agent can be downloaded here. To install and configure the Feedback Agent, please refer to the section "Server Feedback Agent" in the Microsoft Remote Desktop Services Deployment Guide.

### 9. Testing

The load balanced Session Host Servers should now be accessible using the Public IP address or corresponding public DNS name. Connect to this address from the Microsoft RDP client (**mstsc.exe**) or equivalent.
10. Loadbalancer.org Technical Support

If you have any questions regarding the appliance or would like assistance designing your deployment, please don’t hesitate to contact our support team: support@loadbalancer.org.

About Loadbalancer.org

Loadbalancer.org’s mission is to ensure that its clients’ businesses are never interrupted. The load balancer experts ask the right questions to get to the heart of what matters, bringing a depth of understanding to each deployment. Experience enables Loadbalancer.org engineers to design less complex, unbreakable solutions - and to provide exceptional personalized support.
