1. About this Guide

This document provides a quick reference guide on how to load balance Nginx Web Servers and configure a WAF using the Enterprise Azure Loadbalancer.org Azure cloud appliance.

- The WAF addresses the OWASP Top 10 vulnerabilities and is very quick and simple to deploy.
- SSL offload is handled by STunnel, HAProxy handles back-end server re-encryption.

2. Software Versions Supported

2.1. Loadbalancer.org Appliance

- V8.9.1 and later

Note: The screenshots used throughout this document aim to track the latest Loadbalancer.org software version. If you're using an older version, or the very latest, the screenshots presented here may not match your WebUI exactly.

2.2. Nginx

- All versions

3. Related Documentation

For additional information, please refer to the Administration Manual and the Azure Quick Start Configuration Guide.

4. Load Balanced Ports / Services

<table>
<thead>
<tr>
<th>Port</th>
<th>Use</th>
<th>Transport Layer Protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>HTTP</td>
<td>TCP</td>
</tr>
<tr>
<td>443</td>
<td>HTTPS</td>
<td>TCP</td>
</tr>
</tbody>
</table>

5. Azure Network Security Group inbound rules

The following inbound rules must be configured in your Network Security Group:

- For Management: TCP 9443 (Appliance WebUI)
- For access to the load balanced Web Services: TCP 80 (HTTP), TCP 443 (HTTPS)

6. Appliance Configuration Overview

6.1. Operation Mode
The load balancer is configured using layer 7 SNAT mode. This mode does not require any mode specific configuration changes to the load balanced Real Servers.

### 6.2. SSL Termination / Re-encryption
SSL Termination is configured on the load balancer. This provides a corresponding HTTPS Virtual Service on port 443. Decrypted traffic is then passed to the WAF for inspection and then to the Layer VIP for load balancing and re-encryption to the Nginx Servers.

### 6.3. Web Server Health-check
A HTTPS negotiate health-check is used to verify that each Nginx Server is available.

### 6.4. Deployment Concept
The diagram below shows how the system is configured.

![Diagram of system configuration](image)

### 7. Deploying & Accessing the Appliance

#### 7.1. Deployment
Deploy the Loadbalancer.org appliance as described in the [Azure Quick Start Configuration Guide](#).

#### 7.2. Accessing the Appliance WebUI
Using a browser, navigate to the public IP address or FQDN on port 9443:

- `https://<Public IP address>:9443`
- `https://<FQDN>:9443`
To configure an FQDN in Azure please refer to this link.

You'll receive a warning about the WebUI's SSL certificate. This is due to the default self signed certificate that is used. If preferred, you can upload your own certificate - for more information, please refer to Appliance Security Features.

If you need to change the port, IP address or protocol that the WebUI listens on, please refer to Service Socket Addresses.

Log in to the WebUI using the following default credentials:

**Username**: loadbalancer  
**Password**: loadbalancer

To change the password, use the WebUI option: *Maintenance > Passwords.*

Once logged in, the WebUI is displayed:
WebUI Menu Options

- **System Overview** - Displays a graphical summary of all VIPs, RIPs and key appliance statistics
- **Local Configuration** - Configure local host settings such as IP address, DNS, system time etc.
- **Cluster Configuration** - Configure load balanced services such as VIPs & RIPs
- **Maintenance** - Perform maintenance tasks such as service restarts and taking backups
- **View Configuration** - Display the saved appliance configuration settings
- **Reports** - View various appliance reports & graphs
- **Logs** - View various appliance logs
- **Support** - Create a support download, contact the support team & access useful links
- **Live Chat** - Start a Live Chat session with one of our Support Engineers

8. Appliance Configuration

8.1. Configure the Virtual Service (VIP)
1. Using the WebUI, navigate to: **Cluster Configuration > Layer 7 – Virtual Services** and click **Add a New Virtual Service**.

2. Enter the following details:

   
<table>
<thead>
<tr>
<th>Virtual Service</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Web-Cluster</td>
</tr>
<tr>
<td>IP Address</td>
<td>10.0.0.125</td>
</tr>
<tr>
<td>Ports</td>
<td>80</td>
</tr>
<tr>
<td>Protocol</td>
<td>HTTP Mode</td>
</tr>
</tbody>
</table>

3. Enter the required **Label** (name) for the VIP, e.g. **Web-Cluster**.

4. Set the **Virtual Service IP Address** field to an appropriate value, e.g. **10.0.0.125**.

5. Set the **Virtual Service Ports** field to the required port, e.g. **80**.

6. Leave **Layer 7 Protocol** set to **HTTP Mode**.

7. Click **Update**.

8. Now click **Modify** next to the newly created VIP.

9. Scroll to the **Health Checks** section.

   - Set **Health Checks** to **Negotiate HTTPS (GET)**.
   - Leave **Request to Send** blank. Leaving **Request to Send** blank will send the health check request to the Web Server’s root directory. Change this if needed.

   - Leave **Response Expected** blank. Leaving **Response Expected** blank will mean that all HTTP 2xx (usually HTTP 200) and HTTP 3xx responses will be considered as valid and the server will be marked as up.

10. Click **Update**.

### 8.2. Define the Real (Nginx) Servers

1. Using the WebUI, navigate to: **Cluster Configuration > Layer 7 – Real Servers** and click **Add a new Real Server** next to the newly created VIP.
2. Enter the following details:

<table>
<thead>
<tr>
<th>Label</th>
<th>Web1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Real Server IP Address</td>
<td>10.0.0.150</td>
</tr>
<tr>
<td>Real Server Port</td>
<td>443</td>
</tr>
<tr>
<td>Re-Encrypt to Backend</td>
<td>☑</td>
</tr>
<tr>
<td>Enable Redirect</td>
<td>☐</td>
</tr>
<tr>
<td>Weight</td>
<td>100</td>
</tr>
</tbody>
</table>

3. Enter an appropriate label for the Real Server, e.g. Web1.

4. Set the Real Server IP Address field to the required address, e.g. 10.0.0.150.

5. Set the Real Server Port to 443.

7. Click Update.

8. Repeat the above steps to add your other Nginx Server(s).

8.3. Upload the Public SSL Certificate

1. Using the WebUI, navigate to: Cluster Configuration > SSL Certificate and click Add a New SSL Certificate.

2. Select Upload prepared PEM/PFX file.

3. Enter the following details:

<table>
<thead>
<tr>
<th>Label</th>
<th>Cert1</th>
</tr>
</thead>
<tbody>
<tr>
<td>File to upload</td>
<td>Choose File Cert1.pfx</td>
</tr>
<tr>
<td>PFX File Password</td>
<td>*********</td>
</tr>
</tbody>
</table>

4. Specify and Label (name) for the certificate, e.g. Cert1.

5. Click Choose File and browse to and select the relevant PFX or PEM file.
6. Enter the **PFX file Password**.

7. Click **Upload Certificate**.

### 8.4. Configure the STunnel Virtual Service (VIP)

STunnel is used to terminate SSL on the load balancer.

1. Using the WebUI, navigate to: *Cluster Configuration > SSL Termination* and click **Add a New Virtual Service**.

2. Enter the following details:

   - **Label**: SSL_Web-Cluster
   - **Associated Virtual Service**: Web-Cluster
   - **Virtual Service Port**: 443
   - **SSL Operation Mode**: High Security
   - **SSL Certificate**: cert1
   - **Source IP Address**: 
   - **Enable Proxy Protocol**: 
   - **Bind Proxy Protocol to L7 VIP**: Web-Cluster

3. Using the **Associated Virtual Service** drop-down, select the Virtual Service created above, e.g. Web-Cluster.

   **Note**: Once the VIP is selected, the **Label** field will be auto-populated with SSL-Web-Cluster. This can be changed if preferred.

4. Ensure that the **Virtual Service Port** is set to **443**.

5. Leave **SSL Operation Mode** set to **High Security**.

6. Select the **SSL Certificate** uploaded previously.

7. Click **Update**.

### 8.5. Configure the WAF

1. Using the WebUI, navigate to: *Cluster Configuration > WAF – Gateway* and click **Add a New WAF Gateway**.

2. Enter the following details:
3. Select the VIP created previously, e.g. **Web-Cluster**.

   **Note**  
   Once the VIP is selected, the **WAF Label** field will be auto-populated with **WAF-Web-Cluster**. This can be changed if preferred.

4. Click **Update**.

   **Note**  
   By default the WAF setting **Rule Engine Traffic Blocking** is disabled when the WAF is created. While disabled this option ensures that the ModSecurity Rule Engine logs any critical errors but does not block any requests. You should leave the WAF in this mode until you are confident that the error logs are not showing false positives. Once you are confident it can be enabled and the WAF will start blocking any malicious requests with a 403 Forbidden response. To enable this setting, click **Modify** next to the WAF gateway, check the **Rule Engine Traffic Blocking** option and click **Update**.

**8.6. Apply the New Settings**

To apply the new settings, HAProxy, STunnel and the WAF must be reloaded. This can be done using the button in the "Commit changes" box at the top of the screen or by using the **Restart Services** menu option:

1. Using the WebUI, navigate to: **Maintenance > Restart Services**.
2. Click **Reload HAProxy**.
3. Click **Reload STunnel**.
4. Click **Reload WAF**.

**9. Testing**

The load balanced Nginx Web Servers should now be accessible on ports 80 & 443 using the Public IP address or corresponding public DNS name.

**10. Logging Client Source IP Addresses in Nginx**

Nginx can be configured to store the value of X-Forwarded-For headers for incoming web traffic. These headers are added by default by the load balancer. This allows upstream servers and network devices to see the real source IP addresses of clients, even though the load balancer is acting as a proxy.

For full details on how to configure Nginx for this, see our blog post.
11. Loadbalancer.org Technical Support

If you have any questions regarding the appliance or would like assistance designing your deployment, please don’t hesitate to contact our support team: support@loadbalancer.org.

About Loadbalancer.org

Loadbalancer.org’s mission is to ensure that its clients’ businesses are never interrupted. The load balancer experts ask the right questions to get to the heart of what matters, bringing a depth of understanding to each deployment. Experience enables Loadbalancer.org engineers to design less complex, unbreakable solutions - and to provide exceptional personalized support.
