1. About this Guide
This guide details the steps required to configure a load balanced PaperCut Application and Secondary print server utilizing Loadbalancer.org appliances. It covers the configuration of the load balancers, Microsoft printer servers and PaperCut application changes that are required to enable load balancing.

For further information on PaperCut High Availability, please refer to the following section of the PaperCut Help Center.

For more information about initial appliance deployment, network configuration and using the Web User Interface (WebUI), please also refer to the relevant Administration Manual:

- v7 Administration Manual
- v8 Administration Manual

2. Loadbalancer.org Appliances Supported
All our products can be used for load balancing PaperCut print servers. The complete list of models is shown below:

<table>
<thead>
<tr>
<th>Discontinued Models</th>
<th>Current Models *</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise R16</td>
<td>Enterprise R20</td>
</tr>
<tr>
<td>Enterprise VA R16</td>
<td>Enterprise MAX</td>
</tr>
<tr>
<td>Enterprise VA</td>
<td>Enterprise 10G</td>
</tr>
<tr>
<td>Enterprise R320</td>
<td>Enterprise 40G</td>
</tr>
<tr>
<td></td>
<td>Enterprise Ultra</td>
</tr>
<tr>
<td></td>
<td>Enterprise VA R20</td>
</tr>
<tr>
<td></td>
<td>Enterprise VA MAX</td>
</tr>
<tr>
<td></td>
<td>Enterprise AWS **</td>
</tr>
<tr>
<td></td>
<td>Enterprise AZURE **</td>
</tr>
<tr>
<td></td>
<td>Enterprise GCP **</td>
</tr>
</tbody>
</table>

* For full specifications of these models please refer to: [http://www.loadbalancer.org/products/hardware](http://www.loadbalancer.org/products/hardware)

** Some features may not be supported, please check with Loadbalancer.org support

3. Loadbalancer.org Software Versions Supported

- V8.4.3 and later

4. Papercut NG, MF and Mobility Print Software Versions Supported

- Papercut NG/MF 20 and later
5. PaperCut

PaperCut is a print management solutions provider which delivers this via three applications:

- **PaperCut NG** for easy print management that lets you hit the ground running with full tracking, visibility. It comes with detailed print job tracking and reporting to truly rein in costly, wasteful printing. Boasting eco-friendly policies to help you use less paper, save on toner, and make sustainable habits the status quo.

- **PaperCut MF** lets you cut costs and waste in your workplace by managing print, scan, copy, and fax. It has powerful exclusive features including Secure Print Release, Integrated Scanning, Scan to Cloud and Job Ticketing.

- **PaperCut Mobility Print** keeps users printing when they’re outside your network, or on an untrusted guest network. It keeps jobs local to keep printing quick, and only uses the Internet when necessary — and cloud jobs compress and encrypt to save space and keep your data safe.

**PaperCut Print Server Components**

**Application Server**
This is the main application, where you can administer reports, printing costs and print quotas, as well as other print-related actions.

Note: When deploying an Application server in failover mode it is recommend to move print queues over to the PaperCut secondary servers. It is also recommend to move the Web print, print deploy service on to share storage. For details on PaperCut’s recommended deployment methods for the application servers, see their documentation for Application Server Failover.

**Secondary Server (Print Provider, Mobility Print)**
This reports to the application server, updating user and print information that the secondary print server has handled.

Note: Mobility Print can be installed on the secondary print servers and can be made highly available when placed behind a load balancer. Mobility Print allows users to print from their mobile devices via network print services and can be load balanced using TCP/UDP 53, 9163, and 9164.

**Site Server**
The PaperCut Site Server component ensures continuous availability of printing resources to support key business functions over unreliable network links or during unplanned network disruptions, in remote offices. It is ready to take over the role of a Primary Application Server in the event of a WAN outage. Key roles taken over include authentication, copy and print tracking and Find-Me printing, leaving a remote office with the ability to still be able to print.
6. Load Balancing PaperCut

Note: It's highly recommended that you have a working PaperCut version 20 or later environment first before implementing the load balancer, please see the PaperCut Help Center for further details.

Load Balancing & HA Requirements
This guide details the configuration of a load balanced Microsoft print server deployment using the PaperCut application.

For load balancing print servers, the preferred and default load balancer configuration uses Layer 4 DR Mode (Direct Routing, aka DSR / Direct Server Return). This is a very high performance solution that requires little change to your existing infrastructure. It is necessary to solve “the ARP problem” on the real print servers. This is a straightforward process, and is covered in section 2 of the appendix, “DR Mode Server Configuration”, on page 32.

It is also possible to load balance a PaperCut Secondary print server using Layer 4 SNAT Mode. This mode might be preferable if making changes to the real print servers is not possible, although some Windows Registry keys need to be added. Please note that load balanced connections using layer 4 SNAT mode are not source IP transparent, which is not usually an issue when load balancing print servers but should still be considered.

Note: The PaperCut Application servers can only be deployed in an active-passive configuration when placed behind the load balancer. This is known as a ‘failover’ configuration and purely provides high availability, not load balancing.

In order to configure the Application servers in an active-passive configuration, the environment must be deployed with:

- A persistent network drive accessible by all servers
- A highly available external database (RDBMS), such as:
  - Microsoft SQL Server
  - PostgreSQL
  - MySQL
  - Oracle

Configuring the external database is beyond the scope of this guide.

Persistence (aka Server Affinity)
Neither Microsoft print servers or the PaperCut application require session affinity at the load balancing layer.
Virtual Service (VIP) Requirements
To provide load balancing and HA for Papercut, the following VIPs are required:

- PaperCut Application Servers
- PaperCut Mobility Print
- PaperCut Print Provider

Load Balanced Ports
The following table shows the ports that are load balanced:

<table>
<thead>
<tr>
<th>Ports</th>
<th>Use</th>
<th>Transport Layer Protocols</th>
</tr>
</thead>
<tbody>
<tr>
<td>445</td>
<td>Papercut Print Provider</td>
<td>TCP</td>
</tr>
<tr>
<td>53, 9163, 9164</td>
<td>Papercut Mobility Print</td>
<td>TCP/UDP</td>
</tr>
<tr>
<td>9191,9192,9193</td>
<td>Papercut Web User Interface</td>
<td>TCP</td>
</tr>
<tr>
<td>9173, 9175</td>
<td>Papercut Print Deploy</td>
<td>TCP</td>
</tr>
</tbody>
</table>

Note: A list of additional ports required to configure high availability to work with your required Multifunctional Device vendor can be found on the PaperCut Help Center.
7. Deployment Concept

VIPs = Virtual IP Addresses

Note: The load balancer can be deployed as a single unit, although Loadbalancer.org recommends a clustered pair for resilience & high availability. Please refer to section 3 in the appendix on page 30 for more details on configuring a clustered pair.

8. Load Balancer Deployment Methods

The load balancer can be deployed in 4 fundamental ways: Layer 4 DR mode, Layer 4 NAT mode, Layer 4 SNAT mode and Layer 7 SNAT mode.

For Microsoft Print Servers using PaperCut, layer 4 DR mode and layer 4 SNAT mode are recommended. These modes are described below and are used for the configurations presented in this guide. For configuring using DR mode please refer to the section starting on page 14, and for configuring using layer 4 SNAT mode refer to the section starting on page 20.
Layer 4 DR Mode

One-arm direct routing (DR) mode is a very high performance solution that requires little change to your existing infrastructure.

Note: Kemp, Brocade, Barracuda & A10 Networks call this Direct Server Return and F5 call it N-Path.

- DR mode works by changing the destination MAC address of the incoming packet to match the selected Real Server on the fly which is very fast.
- When the packet reaches the Real Server it expects the Real Server to own the Virtual Services IP address (VIP). This means that you need to ensure that the Real Server (and the load balanced application) respond to both the Real Servers own IP address and the VIP.
- The Real Server should not respond to ARP requests for the VIP. Only the load balancer should do this. Configuring the Real Servers in this way is referred to as Solving the ARP Problem. Please refer to page 25 for more information.
- On average, DR mode is 8 times quicker than NAT for HTTP, 50 times quicker for Terminal Services and much, much faster for streaming media or FTP.
- The load balancer must have an Interface in the same subnet as the Real Servers to ensure layer 2 connectivity required for DR mode to work.
- The VIP can be brought up on the same subnet as the Real Servers, or on a different subnet provided that the load balancer has an interface in that subnet.
- Port translation is not possible in DR mode i.e. having a different RIP port than the VIP port.
- DR mode is transparent, i.e. the Real Server will see the source IP address of the client.
Layer 4 SNAT Mode

Layer 4 SNAT mode is also a high performance solution, although not as fast as the other layer 4 modes.

- The load balancer translates all requests from the external Virtual Service to the internal Real Servers in the same way as NAT mode (please refer to the previous page for details).
- Layer 4 SNAT mode is not transparent, an iptables SNAT rule translates the source IP address to be the load balancer rather than the original client IP address.
- Layer 4 SNAT mode can be deployed using either a one-arm or two-arm configuration.
- For two-arm deployments, eth0 is normally used for the internal network and eth1 is used for the external network although this is not mandatory. If the Real Servers require Internet access, Autonat should be enabled using the WebUI option: Cluster Configuration > Layer 4 – Advanced Configuration, the external interface should be selected.
- Port translation is not possible in layer 4 SNAT mode i.e. having a different RIP port than the VIP port.
- You should not use the same RIP:PORT combination for layer 7 SNAT mode VIPs and layer 4 SNAT mode VIPs because the required firewall rules conflict.
Our Recommendation
Where possible, we recommend that Layer 4 Direct Routing (DR) mode is used. This mode offers the best possible performance since replies go directly from the Real Servers to the client, not via the load balancer. It’s also relatively simple to implement. Ultimately, the final choice does depend on your specific requirements and infrastructure.

If DR mode cannot be used, for example if it is not possible to make changes to the real servers, or if the real servers are located in remote routed networks, then layer 4 SNAT mode is recommended.

9. Configuring Microsoft Print Servers using PaperCut for Load Balancing

To configure Microsoft print servers for load balancing the following settings need to be applied:

Registry Modifications
For the print servers that are going to be load balanced, to enable them to be accessed via a shared name.

Configuring Name Resolution
For printer load balancing to work, DNS name resolution should be configured. A host name and corresponding “Host (A)” record for the virtual service should be created, and should match the virtual IP (VIP) address defined on the load balancer.

Note: Details of the required changes for registry modifications and configuring name resolution can be found under the section PaperCut Microsoft Print Server Configuration

Layer 4 DR Mode – Solving the ARP Problem
If using layer 4 DR mode, the ‘ARP problem’ must be solved on each real server for DR mode to work. For detailed steps on solving the ARP problem, please refer to section 2 of the appendix on page 32 for more information. For a detailed explanation of DR mode and the nature of the ARP problem, please refer to the section that covers layer 4 DR mode on page 9.
10. Loadbalancer.org Appliance – the Basics

Virtual Appliance Download & Deployment
A fully featured, fully supported 30 day trial is available if you are conducting a PoC (Proof of Concept) deployment. The VA is currently available for VMware, Virtual Box, Hyper-V, KVM and Xen and has been optimized for each Hypervisor. By default, the VA is allocated 1 CPU, 2GB of RAM and has an 8GB virtual disk. The Virtual Appliance can be downloaded here.

Note: The same download is used for the licensed product, the only difference is that a license key file (supplied by our sales team when the product is purchased) must be applied using the appliance’s WebUI.

Note: Please refer to the Administration Manual and the ReadMe.txt text file included in the VA download for more detailed information on deploying the VA using various Hypervisors.

Initial Network Configuration
The IP address, subnet mask, default gateway and DNS settings can be configured in several ways as detailed below:

Method 1 - Using the Network Setup Wizard at the console
After boot up, follow the instructions on the console to configure the IP address, subnet mask, default gateway and DNS settings.

Method 2 - Using the WebUI
Using a browser, connect to the WebUI on the default IP address/port: https://192.168.2.21:9443
To set the IP address & subnet mask, use: Local Configuration > Network Interface Configuration
To set the default gateway, use: Local Configuration > Routing
To configure DNS settings, use: Local Configuration > Hostname & DNS

Accessing the Web User Interface (WebUI)
The WebUI can be accessed via HTTPS at the following URL: https://192.168.2.21:9443/lbadmin
* Note the port number → 9443

(replace 192.168.2.21 with the IP address of your load balancer if it’s been changed from the default)

Login using the following credentials:
**Username:** loadbalancer  
**Password:** loadbalancer

Note: To change the password, use the WebUI menu option: Maintenance > Passwords.

Once logged in, the WebUI will be displayed as shown below:

![WebUI interface](image)

**HA Clustered Pair Configuration**

Loadbalancer.org recommend that load balancer appliances are deployed in pairs for high availability. In this guide a single unit is deployed first, adding a secondary slave unit is covered in section 1 of the appendix on page 30.
11. Appliance Configuration for PaperCut Print Servers – Using Layer 4 DR Mode

When deploying PaperCut, three virtual services must be configured: a virtual service for the PaperCut Application Server, the Print Provider, and a virtual service for the PaperCut Mobility Print.

Configuring VIP 1 – PaperCut Application Servers

Configuring The Virtual Service (VIP)

1. Using the web user interface, navigate to Cluster Configuration > Layer 4 – Virtual Services and click on Add a new Virtual Service
2. Define the required Label (name) for the VIP, e.g. PaperCut_WUI
3. Set the Virtual Service IP address field to the required IP address, e.g. 172.24.11.38
4. Set the Virtual Service Ports field to 9191,9192,9193
5. Leave the Protocol set to TCP
6. Leave the Forwarding Method set to Direct Routing
7. Click Update to create the virtual service

8. Now click Modify next to the newly created Virtual Service
9. Disable Persistence by unchecking the Enable check box
10. Under Health Checks set the Check Type to Negotiate
11. Leave the Check Port field empty
12. In the Request to send field put the application server health monitoring authorization key which can be found
in the HTTP header:
/api/health/application-server/status?disk-threshold-mb=1&Authorization=<AUTHORIZATION KEY>
The HTTP header can be found in the Application server under Web user interface > Options > Advanced

13. Click Update

Note: In some cases other ports may need to be forwarded such as port 9192, 9193 and additional ports depending on a customers multifunctional devices. For a list of PaperCut ports please refer to the PaperCut Help Center.

Define The Real (Active Application Server) Server

1. Using the WebUI, navigate to: Cluster Configuration > Layer 4 – Real Servers and click Add a new Real Server next to the newly created VIP
2. Enter the following details:

3. Enter an appropriate label for the Real Server, e.g. App_Svr1
4. Change the Real Server IP Address field to the required address, e.g. 172.24.11.36
5. Click Update
6. Repeat the above steps for the remaining application server
Configuring VIP 2 – PaperCut Secondary Server (PaperCut Print Provider)

Configuring The Virtual Service (VIP)

1. Using the web user interface, navigate to Cluster Configuration > Layer 4 – Virtual Services and click on Add a new Virtual Service
2. Define the required Label (name) for the VIP, e.g. Print_Provider
3. Set the Virtual Service IP address field to the required IP address, e.g. 172.24.11.38
4. Set the Virtual Service Ports field to 445
5. Leave the Protocol set to TCP
6. Leave the Forwarding Method set to Direct Routing
7. Click Update to create the virtual service
8. Now click Modify next to the newly created Virtual Service
9. Disable Persistence by unchecking the Enable check box
10. Click Update

![Layer 4 - Add a new Virtual Service](image)

Define The Real (Print Server) Servers

1. Using the WebUI, navigate to: Cluster Configuration > Layer 4 – Real Servers and click Add a new Real Server next to the newly created VIP
2. Enter the following details:
3. Enter an appropriate label for the Real Server, e.g. **PS1**
4. Change the **Real Server IP Address** field to the required address, e.g. **172.24.11.39**
5. Click **Update**
6. Repeat the above steps to add your other Print Server(s)

Note: In the next section, "Configuring VIP 3 – PaperCut Mobility Print" we will make use of the **Duplicate Service** button to retain the configuration including the added real servers. We will then need to amend the configuration with a new label and IP address accordingly, while other configuration items, such as added real servers, will be retained.

### Configuring VIP 3 – PaperCut Mobility Print

**Configuring The Virtual Service (VIP)**

1. Using the web user interface, navigate to **Cluster Configuration > Layer 4 – Virtual Services** and click on **Modify** on the **PrintProviderVIP** virtual service
2. Click the **Duplicate Service** located in the top right of the menu
3. Define the required **Label** (name) for the VIP, e.g. **MobilityPrint**
4. Set the **Virtual Service Ports** field to **53,9163,9164**
5. Leave the **Protocol** set to **TCP/UDP**
6. Leave the **Forwarding Method** set to **Direct Routing**
7. Under the Health Checks set the Check Port to **9163**
8. Click **Update**

Note: Please be aware that Mobility Print will need to be installed on the same Secondary print servers within the cluster. However it is recommended that you segregate these services at a VIP level as this allows for the more granular control and health checking of those services. For example if you create a singular VIP with multiple services being load balanced by that VIP, should one of those services were to fail the VIP and corresponding real server will also be marked as down. Having a singular multi service VIP is fine during testing but not recommended for production.
Finalizing the Layer 4 DR mode Configuration

When using a layer 4 DR mode configuration, all real servers need to be configured to solve the “ARP problem.”

The ARP Problem

DR mode works by changing the MAC address of the inbound packets to match the Real Server selected by the load balancing algorithm. To enable DR mode to operate:

- Each Real Server must be configured to accept packets destined for both the VIP address and the Real Server’s IP address (RIP). This is because in DR mode the destination address of load balanced packets is the VIP address, whilst for other traffic such as health checks, administration traffic etc. it’s the Real Server’s own IP address (the RIP). The service/process (e.g. IIS) must also respond to both addresses.
- Each Real Server must be configured so that it does not respond to ARP requests for the VIP address – only the load balancer should do this.

Configuring the Real Servers in this way is referred to as “Solving the ARP problem”. The steps required depend on the OS used as detailed on page 32.

To complete the configuration ensure that the correct registry and DNS settings have been applied as per the steps under the section of PaperCut Microsoft Print Server Configuration.
12. Appliance Configuration for PaperCut Print Servers – Using Layer 4 SNAT Mode

When deploying PaperCut, three virtual services must be configured: a virtual service for the PaperCut Application Server, the Print Provider, and a virtual service for the PaperCut Mobility Print.

Configuring VIP 1 – PaperCut Application Servers

Configuring The Virtual Service (VIP)

1. Using the web user interface, navigate to Cluster Configuration > Layer 4 – Virtual Services and click on Add a new Virtual Service
2. Define the required Label (name) for the VIP, e.g. Papercut_WUI
3. Set the Virtual Service IP address field to the required IP address, e.g. 172.24.11.38
4. Set the Virtual Service Ports field to 9191,9192,9193
5. Leave the Protocol set to TCP
6. Leave the Forwarding Method set to SNAT
7. Click Update to create the virtual service

8. Now click Modify next to the newly created Virtual Service
9. Disable Persistence by unchecking the Enable check box
10. Under Health Checks set the Check Type to Negotiate
11. Leave the Check Port field empty
12. In the Request to send field put the application server health monitoring authorization key which can be found in the HTTP header:
The HTTP header can be found in the Application server under Web user interface > Options > Advanced

13. Click Update

Define The Real (Active Application Server) Server

1. Using the WebUI, navigate to: Cluster Configuration > Layer 4 – Real Servers and click Add a new Real Server next to the newly created VIP
2. Enter the following details:

3. Enter an appropriate Label for the Real Server, e.g. App_Svr1
4. Change the Real Server IP Address field to the required address, e.g. 172.24.11.36
5. Click Update
6. Repeat the above steps for the remaining application server
Configuring VIP 2 – PaperCut Secondary Server (PaperCut Print Provider)

Configuring The Virtual Service (VIP)

1. Using the web user interface, navigate to Cluster Configuration > Layer 4 – Virtual Services and click on Add a new Virtual Service
2. Define the required Label (name) for the VIP, e.g. **Print_Provider**
3. Set the Virtual Service IP address field to the required IP address, e.g. **172.24.11.38**
4. Set the Virtual Service Ports field to **445**
5. Leave the Protocol set to **TCP**
6. Leave the Forwarding Method set to **SNAT**
7. Click Update to create the virtual service
8. Now click Modify next to the newly created Virtual Service
9. Disable Persistence by unchecking the Enable check box
10. Click Update

![Layer 4 - Add a new Virtual Service](image)

Define The Real (Print Server) Servers

1. Using the WebUI, navigate to: Cluster Configuration > Layer 4 – Real Servers and click Add a new Real Server next to the newly created VIP
2. Enter the following details:
<table>
<thead>
<tr>
<th>Label</th>
<th>PS1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Real Server IP Address</td>
<td>172.24.11.39</td>
</tr>
<tr>
<td>Weight</td>
<td>100</td>
</tr>
<tr>
<td>Minimum Connections</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Connections</td>
<td>0</td>
</tr>
</tbody>
</table>
Note: In the next section, “Configuring VIP 3 – PaperCut Mobility Print”, we will make use of the Duplicate Service button to retain the configuration including the added real servers. We will then need to amend the configuration with a new label and IP address accordingly, while other configuration items, such as added real servers, will be retained.

Configuring VIP 3 – PaperCut Mobility Print

Configuring The Virtual Service (VIP)

1. Using the web user interface, navigate to Cluster Configuration > Layer 4 – Virtual Services and click on Modify on the PrintProviderVIP virtual service
2. Click the Duplicate Service located in the top right of the menu
3. Define the required Label (name) for the VIP, e.g. MobilityPrint
4. Set the Virtual Service Ports field to 53,9163,9164
5. Leave the Protocol set to TCP/UDP
6. Leave the Forwarding Method set to SNAT
7. Under the Health Checks set the Check Port to 9163
8. Click Update
Finalizing the Configuration

PaperCut Microsoft Print Server Configuration

Step 1 - Initial Configuration

Complete the following steps on each print server:

1. Join the server to the same domain as the client PCs
2. Install the Print and Document Service role / Print Server service
3. Install & share the printers (use the same share names and permissions across all servers)
Step 2 – Registry Modifications

To enable the print servers to be accessed via a shared name (PapercutPrintService in this guide), add the following registry entries to each print server:

<table>
<thead>
<tr>
<th>Ref.</th>
<th>Registry Key Requirements</th>
</tr>
</thead>
</table>
| 1    | Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Lsa  
Value: DisableLoopbackCheck  
Type: REG_DWORD  
Data: 1 |
| 2    | Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\lanmanserver\parameters  
Value: DisableStrictNameChecking  
Type: REG_DWORD  
Data: 1 |
| 3    | Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\lanmanserver\parameters  
Value: OptionalNames  
Type: REG_MULTI_SZ  
Data: PapercutPrintService |

Note: 'PapercutPrintService' is the name that will be used to access the load balanced print servers via the Virtual Service (VIP) created on the load balancer. This can be set to be any appropriate name. Whatever name is used, it must be the same name that is used for the DNS or NetBIOS entry described in the Configure Name Resolution section below.

Step 3 – Configure Name Resolution

Configure either DNS name resolution as detailed below:

**DNS Name Resolution**

To configure DNS name resolution complete the following steps:

1. Disable NetBIOS over TCP/IP on all interfaces of each print server
2. Create a DNS record for the share name, in this example: PapercutPrintService -> 172.24.11.38

Step 4 – Server Reboot

To apply all the changes, reboot each print server.
Deploying Printers Via Group Policy

- Ensure that the load balanced print server name (e.g. PapercutPrintService) is resolvable by DNS as explained above
- On your print server, open: Administrative Tools > Printer Management
  - Right-click Print Servers and enter the name for your load balanced print server (e.g. PapercutPrintService) and click OK
  - Expand the Printers section
  - Right click the printer you want to deploy, and click Deploy with Group Policy
  - Select the relevant GPO and configure the remaining settings according to your requirements

Note: PaperCut NG and MF have a fantastic feature called Print Deploy which makes deployment of print queues out to end users workstations super simple. For further details please see the PaperCut Help Center.

13. Testing & Verification

You should now be able to access your printers by browsing using either the Virtual Service IP address, or the share name. In this example:

\172.24.11.38

or

\PapercutPrintService

Using System Overview

The System Overview can be viewed in the WebUI. It shows a graphical view of all VIPs & RIPs (i.e. the PaperCut secondary servers) and shows the state/health of each server as well as the state of the each cluster as a whole. The example below shows that all real servers are healthy and available to accept connections.

Note: The Papercut_WUI VIP actively health checks both application servers and will only display the active server in the pool with a green upward arrow. The passive application server will be presented with a red downward arrow until application-server failover occurs on the backend. Servers that are marked with a red arrow will not receive any connections from the load balancer until marked as healthy (green) and online.
Client Connection Tests

Ensure that clients print jobs can succeed via the load balancer to the PaperCut print servers. You'll probably need to create new DNS records or modify your existing DNS records, replacing the IP addresses of individual servers or the cluster with the IP address of the Virtual Service on the load balancer.

Note: For more details on testing & diagnosing load balanced services please refer to chapter 12 in the Administration Manual.

Testing PaperCut Application Server failover

<table>
<thead>
<tr>
<th>Test</th>
<th>How</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test if the active server is handling traffic.</td>
<td>Attempt to load the PaperCut NG/MF admin web interface using the IP or hostname of the server that you want to test—not the IP/hostname of the NLB. If the server is in the active state, you will see the PaperCut login page.</td>
</tr>
<tr>
<td>Test if the passive server is ready to pick up the load.</td>
<td>Attempt to load the Admin web interface using the IP or hostname of the server that you want to test—not the IP/hostname of the NLB. If the server is in the passive state, you will see a page that looks like this:</td>
</tr>
</tbody>
</table>
14. Technical Support
For more details about configuring the appliance and assistance with designing your deployment please don't hesitate to contact the support team using the following email address: support@loadbalancer.org.

15. Additional Documentation

16. Conclusion
Loadbalancer.org appliances provide a very cost effective solution for a highly available load balanced PaperCut print server environments.
17. Appendix

1 – Clustered Pair Configuration – Adding a Slave Unit
If you initially configured just the master unit and now need to add a slave – our recommended procedure, please refer to the relevant section below for more details:

Note: A number of settings are not replicated as part of the master/slave pairing process and therefore must be manually configured on the slave appliance. These are listed below:

• Hostname & DNS settings
• Network settings including IP addresses, bonding configuration and VLANs
• Routing configuration including default gateways and static routes
• Date & time settings
• Physical – Advanced Configuration settings including Internet Proxy IP address & port, Firewall table size, SMTP relay and Syslog server
• SNMP settings
• Graphing settings
• Firewall Script & Firewall Lockdown Script settings
• Software updates

To add a slave node – i.e. create a highly available clustered pair:

• Deploy a second appliance that will be the slave and configure initial network settings
• Using the WebUI, navigate to: Cluster Configuration > High-Availability Configuration

- Specify the IP address and the loadbalancer users password (the default is 'loadbalancer') for the slave (peer) appliance as shown above
• Click **Add new node**

• The pairing process now commences as shown below:

![Create a Clustered Pair](image)

- **Once complete, the following will be displayed:**

![High Availability Configuration - Master](image)

- **To finalize the configuration, restart heartbeat and any other services as prompted in the blue message box at the top of the screen**

- **Note:** Clicking the Restart Heartbeat button on the master appliance will also automatically restart heartbeat on the slave appliance.

- **Note:** Please refer to chapter 9 – Appliance Clustering for HA in the Administration Manual for more detailed information on configuring HA with 2 appliances.
2 – DR Mode Server Configuration
When using Layer 4 DR mode the ARP problem must be solved. This involves configuring each Papercut Secondary Print Server to accept traffic destined for the VIP in addition to its own IP address, and ensuring that each server does not respond to ARP requests for the VIP address – only the load balancer should do this.

Detecting the ARP Problem
Attempt to connect to the VIP and then use Reports > Layer 4 Current Connections to check whether the connection state is SYN_RECV as shown below.

If it is, this is normally a good indication that the ARP problem has not been correctly solved.

Solving the ARP Problem for Linux

Method 1 (using iptables)
You can use iptables (netfilter) on each Real Server to re-direct incoming packets destined for the Virtual Service IP address. To make this permanent, simply add the following command to an appropriate start-up script such as /etc/rc.local on each of your Real Servers. If Real Servers are serving multiple VIPs, add additional iptables rules for each VIP.

```
iptables -t nat -A PREROUTING -d <VIP> -j REDIRECT
```

E.g.

```
iptables -t nat -A PREROUTING -d 10.0.0.21 -j REDIRECT
```

*(Change the IP address to be the same as your Virtual Service)*

This means redirect any incoming packets destined for 10.0.0.21 (the Virtual Service) locally, i.e. to the primary address of the incoming interface on the Real Server.

Note: Method 1 may not always be appropriate if you’re using IP-based virtual hosting on your web server. This is because the iptables rule above redirects incoming packets to the primary address of
the incoming interface on the web server rather than any of the virtual hosts that are configured. Where this is an issue, use method 2 below instead. Also, Method 1 does not work with IPv6 Virtual Services, use method 2 below instead.

Method 2 (using `arp_ignore` `sysctl` values)
This is the preferred method as it supports both IPv4 and IPv6. Each Real Server needs the loopback adapter to be configured with the Virtual Services IP address. This address must not respond to ARP requests and the web server also needs to be configured to respond to this address. To set this up, follow steps 1-4 below on each Real Server.

Step 1 of 4: re-configure ARP on the Real Servers (this step can be skipped for IPv6 Virtual Services)
To do this add the following lines to `/etc/sysctl.conf`:

```
net.ipv4.conf.all.arp_ignore=1
net.ipv4.conf.eth0.arp_ignore=1
net.ipv4.conf.eth1.arp_ignore=1
net.ipv4.conf.all.arp_announce=2
net.ipv4.conf.eth0.arp_announce=2
net.ipv4.conf.eth1.arp_announce=2
```

Note: Adjust the commands shown above to suit the network configuration of your servers.

Step 2 of 4: re-configure DAD on the Real Servers (this step can be skipped for IPv4 Virtual Services)
To do this add the following lines to `/etc/sysctl.conf`:

```
net.ipv6.conf.lo.dad_transmits=0
net.ipv6.conf.lo.accept_dad=0
```

Step 3 of 4: apply these settings
Either reboot the Real Server or run the following command to apply these settings:

```
/sbin/sysctl -p
```

Step 4 of 4: add the Virtual Services IP address to the loopback adapter
Run the following command for each VIP. To make this permanent, simply add the command to an appropriate startup script such as `/etc/rc.local`.

```
ip addr add dev lo <IPv4-VIP>/32
```

for IPv6 addresses use:
ip addr add dev lo <Ipv6-VIP>/128

Note: You can check if this command added the VIP successfully using the command:

```
ip addr ls
```

You can remove the VIP from the loopback adapter using the command:

```
ip addr del dev lo <Ipv4-VIP>/32
```

Note: Steps 1, 2 & 3 can be replaced by writing directly to the required files using the following commands (run as root at the command line), this is temporary until the next reboot:

```
    echo 1 > /proc/sys/net/ipv4/conf/all/arp_ignore
    echo 1 > /proc/sys/net/ipv4/conf/eth0/arp_ignore
    echo 1 > /proc/sys/net/ipv4/conf/eth1/arp_ignore
    echo 2 > /proc/sys/net/ipv4/conf/all/arp_announce
    echo 2 > /proc/sys/net/ipv4/conf/eth0/arp_announce
    echo 2 > /proc/sys/net/ipv4/conf/eth1/arp_announce
    echo 0 > /proc/sys/net/ipv6/conf/lo/dad_transmits
    echo 0 > /proc/sys/net/ipv6/conf/lo/accept_dad
```

**Solving the ARP Problem for Mac OS X/BSD**

OS X is BSDish, so you need to use BSDish syntax:

```
ifconfig lo0 alias <VIP> netmask 255.255.255.255 -arp up
```

You’ll need to add this to the startup scripts on all of your Real Servers.

Note: Don’t forget that the service on the Real Servers needs to listen on both the RIP address and VIP address as mentioned previously. Failure to correctly configure the Real Servers to handle the ARP problem is the most common mistake in DR mode configurations.

**Solving the ARP Problem for Windows Servers**

**Windows Server 2012/2016/2019**

Windows Server 2012/2016 supports the direct routing (DR) method through the use of the MS Loopback Adapter to handle the traffic. The IP address on the Loopback Adapter must be set to be the same as the Virtual Services IP address (VIP). If the Real Server is included in multiple VIPs, you can add additional IP addresses to the Loopback Adapter that correspond to each VIP. Additional steps are required to set the strong/weak host behaviour. This is used to either block or allow interfaces receiving packets destined for a different interface on the same server. If the Real
Server is included in multiple VIPs, you can add additional IP addresses to the Loopback Adapter that correspond to each VIP.

**Note:** The steps below are for Windows 2012 / 2016 / 2019 IPv4 addresses, for other versions of Windows & IPv6 configuration steps, please refer to chapter 6 in the *Administration Manual*.

**Step 1 of 3 : Install the Microsoft Loopback Adapter**

1. Click **Start**, then run `hdwwiz` to start the Hardware Installation Wizard.
2. When the Wizard has started, click **Next**.
3. Select **Install the hardware that I manually select from a list (Advanced)**, click **Next**.
4. Select **Network adapters**, click **Next**.
5. Select **Microsoft & Microsoft KM-Test Loopback Adapter**, click **Next**.

![Microsoft KM-Test Loopback Adapter installation screen](image)

6. Click **Next** to start the installation, when complete click **Finish**.

**Step 2 of 3: Configure the Loopback Adapter**

1. Open Control Panel and click **Network and Sharing Center**.
2. Click **Change adapter settings**.
3. Right-click the new Loopback Adapter and select **Properties**.
4. Un-check all items except **Client for Microsoft Networks, File and Printer Sharing for Microsoft Networks, and Internet Protocol Version 4 (TCP/IPv4)** as shown below:
5. For IPv4 addresses, select Internet Protocol Version (TCP/IPv4), click Properties and configure the IP address to be the same as the address you've used for the Virtual Service (VIP) with a subnet mask of 255.255.255.255, e.g. 192.168.100.100/255.255.255.255 as shown below:

6. Click OK on TCP/IPv4 Properties, then click Close on the Interface Properties to save and apply the new settings.
Step 3 of 3: Configure the strong/weak host behaviour

Windows Server 2000 and Windows Server 2003 use the weak host model for sending and receiving for all IPv4 interfaces and the strong host model for sending and receiving for all IPv6 interfaces. You cannot configure this behaviour. The Next Generation TCP/IP stack in Windows 2008 and later supports strong host sends and receives for both IPv4 and IPv6 by default. To ensure that Windows 2012/2016 is running in the correct mode to be able to respond to the VIP, the following commands must be run on each Real Server:

For IPv4 addresses:

```
netsh interface ipv4 set interface "net" weakhostreceive=enabled
netsh interface ipv4 set interface "loopback" weakhostreceive=enabled
netsh interface ipv4 set interface "loopback" weakhostsend=enabled
```

For IPv6 addresses:

```
netsh interface ipv6 set interface "net" weakhostreceive=enabled
netsh interface ipv6 set interface "loopback" weakhostreceive=enabled
netsh interface ipv6 set interface "loopback" weakhostsend=enabled
```

For these commands to work, the LAN connection NIC must be named “net” and the loopback NIC must be named “loopback” as shown below. If you prefer to leave your current NIC names, then the commands above must be modified accordingly. For example, if your network adapters are named “LAN” and “LOOPBACK”, the commands required would be:

```
netsh interface ipv4 set interface "LAN" weakhostreceive=enabled
netsh interface ipv4 set interface "LOOPBACK" weakhostreceive=enabled
netsh interface ipv4 set interface "LOOPBACK" weakhostsend=enabled
```

Note: The names for the NICs are case sensitive, so make sure that the name used for the interface and the name used in the commands match exactly.

- Start Powershell or use a command window to run the appropriate netsh commands as shown in the example below:
Repeat steps 1 – 3 on all remaining Papercut Print Server(s).
## Document Revision History

About Loadbalancer.org

Loadbalancer.org's mission is to ensure that its clients' businesses are never interrupted. The load balancer experts ask the right questions to get to the heart of what matters, bringing a depth of understanding to each deployment. Experience enables Loadbalancer.org engineers to design less complex, unbreakable solutions - and to provide exceptional personalized support.
